Title: us-10-646-391a-1
Perfect score: 1676
Sequence: 1 gaattccgcgcgtgaccgag.....aaaaaaaaaagggaattc 1676

Scoring table: IDENTITY_NUC
Gapop 10.0 , Gapext 0.5

Searched: 1187 seqs, 22896 residues

Total number of hits satisfying chosen parameters: 2374

Minimum DB seq length: 8
Maximum DB seq length: 50

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 1187 summaries

Database : rgedb:*

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Database : rngdb:*

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

PT Detecting mutated polynucleotides in a large population of wild-type
PT polynucleotides, useful for e.g. detecting cancer, comprises using
PT polymerase chain reaction amplification of extension products from mutant
PT polynucleotides.
XX
PS Example 2; SEQ ID NO 3; 37pp; English.

CC The present invention relates to detecting a mutant polynucleotide in a
CC mixture of mutant polynucleotides, wild-type polynucleotides and
CC unrelated polynucleotides, comprises using polymerase chain reaction
CC amplification of extension products produced from mutant polynucleotide
CC templates and by extension primers and probes. The method is useful in
CC detecting mutated polynucleotides within a large population of wild-type
CC polynucleotides. The method may be used in diagnosing or detecting
CC cancer, such as colorectal cancer, in an individual. The present sequence
XX represents a probe of the invention.

PT Production of cytochrome c by culturing prokaryote transformed with
PT vector containing e.g. DNA of signal peptide and of eukaryotic cytochrome
PT c maturation protein for use in reagents and drugs for trapping nitrogen
PT oxide.
XX
PS Example 1; Page 7-8; 27pp; Japanese.
XX
CC The invention comprises a method for the production of cytochrome C. The
CC method involves culturing a prokaryote that has been transformed with a
CC vector encoding a signal peptide and a cytochrome C maturation protein.
CC The method of the invention is useful for producing cytochrome C.
CC Cytochrome C produced by the method of the invention is used in reagents
CC and drugs for trapping nitrogen oxide (e.g. in purifying polluted
CC atmosphere by trapping nitrogen oxide). The present DNA sequence
CC represents a Porphyra yezoensis cytochrome C - related PCR primer

PT Detecting or diagnosing a kidney disease, e.g. renal cancer or
PT glomerulonephritis, comprises determining the presence of expression of a
PT podocyte gene for nephrin or proximal tubular cell gene for Indian
PT hedgehog in a urine sample.
XX
PS Claim 39; Page 24; Opp; English.
XX
CC The present invention relates to a method of detecting a kidney disease,
CC which comprises screening a mammalian urine sample for expression of a
CC specific gene that is present in the urine sample only when cells
CC indicating kidney disease are present, where the concentration of
CC detectable albumin in the urine sample has a range of 0-30 mg/dl. The
CC method is useful for detecting or diagnosing a kidney disease or
CC disorders associated with e.g. glomerulonephritis, nephritic syndrome,
CC diabetes, lupus, hypertension, acute tubular necrosis, renal obstructive
CC disorders, renal cancers, and other diseases or symptoms. The podocyte
CC gene for nephrin or the proximal tubular cell gene for Indian hedgehog is
CC useful as selectable markers for a kidney disease. The present sequence
CC is a PCR primer used to detect the human beta-actin gene

CC adapter, to form a nucleic acid mixture, (c) denaturing and re-annealing
CC the tester/driver nucleic acid mixture, (d) adding to the nucleic acid
CC mixture an effective amount of reagents necessary for removing the
CC adapter sequence from the tester/ driver hetero-duplex and (e) repeating
CC step (c) to (d) at least once (no amplification takes place and no
CC additional driver is added). The method is used for rapid isolation and
CC enrichment of the differences of DNA fragments between two pools of DNA
CC e.g. in the search for tumour specific sequences. The method has 2
CC improvements over the methods disclosed by Yang et al. (1996), Lisitsyn
CC et al. (1993), Straus et al. (1990) by (i) bypassing the need of a
CC polymerase chain reaction (PCR) amplification or physical separation of
CC desirable testers from undesirable ones in each repeat of subtraction, it
CC eliminates the necessity of tester dilution in each repeat of
CC subtraction, and (ii) by utilising the convened driver from each repeat
CC of subtraction, it eliminates the need for re-introducing additional
CC driver into hybridisation in each repeat of subtraction. The present
CC sequence is an Oligo D(T) PCR primer used in the method of the invention

PT New pure contryphan peptides.

XX

PS Example 3; Page 20; 48pp; English.

XX

CC The present sequence represents a PCR primer for a contryphan peptide sequence. Contryphan peptides are found in the venom of cone snails. The contryphan peptides are useful as anticonvulsant agents, as neuroprotective agents, for managing pain, and for treating neurodegenerative disorders, especially those resulting from an overstimulation of excitatory amino acid receptors. The contryphans are useful for the treatment and alleviation of epilepsy and as a general anticonvulsant agent. The contryphans are also useful to reduce neurotoxic injury associated with conditions of hypoxia, anoxia, or ischaemia which typically follows stroke, cerebrovascular accident, brain or spinal chord trauma, myocardial infarct, physical trauma, drownings, suffocation, perinatal asphyxia, or hypoglycaemic events. The contryphans are further useful for the treatment of Alzheimer's disease, senile dementia, amyotrophic lateral sclerosis, Parkinson's disease, Huntington's disease, Down's syndrome, Korsakoff's disease, schizophrenia, AIDS dementia, multi-infarct dementia, and neuronal damage associated with uncontrolled seizures. The contryphans are further useful in controlling pain and are effective in the treatment of migraine. They can be used prophylactically or to relieve the symptoms associated with a migraine episode

PT Synthetic nucleic acid probes - comprising two nucleic acid sequences linked by a scissile linkage.

PT

XX Example; p29; 46pp; English.

PS

XX The patent claims a new molecule of formula (NA1-----S-----NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA or RNA sequences in a test soln. The scissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogeneous system when the scissile linkage is an RNA molecule. In the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing OS field.)

XX PT Detecting target nucleic acid molecules - using excess complementary
PT nucleic acid probes and nicking to complete a cycling sequence.
XX PS Disclosure; Page 24; 34pp; English.
XX PF Probe MRCO64 is bound by a hydrolysable linkage to a solid support at its
CC 3' end. It is used by reacting excess probe with a target nucleic acid;
CC nicking hybridised probe at least once within a predetermined sequence to
CC form 2 or more probe fragments hybridised to the target sequence, which
CC results in the probe fragments becoming hybridised to another probe; and
CC identifying probe fragments, so detecting the target sequence. The probe
CC can react with target sequence to complete a cycling sequence. Using this
CC system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

XX
CC This invention describes a novel method for the visual detection of
CC target nucleic acid presence in a sample. A preferred target is a
CC Mycobacterium complex nucleic acid sequence. The detection method uses
CC visual detection of a change in the hybridization without aid of
CC instrumentation. Multiple copies of a target nucleic acid sequence are
CC mixed with first and second detectable probes under hybridizing
CC conditions favouring particle agglutination via a bridging molecule
CC allowing for visual detection of the target nucleic acid sequence. The
CC bridging molecule enhances or inhibits formation of a hybridization
CC complex

CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT Determining an analyte in a sample, for generating multiple double
PT stranded nucleic acids, comprises employing a single primer sequence with
PT a nucleobase sequence having affinity to the sequence contained in a
XX target nucleic acid.
PS
XX Example 1; Col 14; 25pp; English.
XX
CC The invention relates to determining an analyte in a sample comprising
CC (a) providing a target nucleic acid comprising a region A, a nucleobase
CC sequence B, and a sequence I linked to the 5' terminus of the nucleobase
CC sequence B, where the nucleobase sequence B is not specific for the
CC analyte, and the region A specifically binds to the analyte, (b) binding
CC the target nucleic acid to the analyte, separating the analyte bound to
CC the target nucleic acid from the remaining part of the sample, (d)
CC hybridising a primer to the target nucleic acid, where the primer
CC comprises a nucleobase sequence B', and the nucleobase sequence B'
CC hybridises to the nucleobase sequence B, (e) elongating the hybridised
CC primer to produce an elongation product E using the target nucleic acid
CC as a template and using nucleotides, where at least 30 % of the
CC nucleotides contain at least one promiscuous base which is capable of
CC base pairing with each of adenine, guanine, cytosine, and thymine, (f)
CC separating the target nucleic acid from the elongation product E, (g)
CC hybridising a further primer which comprises the nucleobase sequence B'
CC to the elongation product E, where the elongation product E is capable of
CC acting as a template for the elongation of the further primer, (h)
CC elongating the hybridised further primer of step (g) to produce an
CC elongation product E' using the elongation product E as a template and
CC using nucleotides, where at least 30 % of the nucleotides contain at
CC least one promiscuous base, (i) separating the elongation product E from
CC the elongation product E', (j) hybridising a further primer comprising a
CC nucleobase sequence B' to the target nucleic acid or the elongation
CC product E, (k) elongating the further primer of step (j) to produce
CC another elongation product E using the target nucleic acid or elongation
CC product E as a template and using nucleotides, where at least 30 % of the
CC nucleotides contain at least one promiscuous base, (l) separating product
CC E of step (k) from the target nucleic acid or elongation product E, (m)
CC optionally repeating steps (g) - (l) a sufficient number of times to
CC generate a desired amount of double stranded nucleic acids and (n)
CC determining the elongation product E and/or elongation product E' as a
CC measure of the presence or amount of the analyte, where the lengths of
CC the sequence I and the nucleobase sequence B are chosen such that, when
CC the further primer hybridises to the elongation product E in step (g),
CC the further primer spans a sequence formed by elongation of the
CC hybridised primer of step (e) and overlaps at least a part of the 3'
CC region of the hybridized primer of step (e) by an overlap length. The
CC method is useful determining an analyte in a sample. In particular, the
CC method is useful for generating multiple double stranded nucleic acids.

PT Fluorescent dye or its salt, hydrate, solvate or stereoisomer for nucleic
PT acid probe for measuring nucleic acid(s) containing specific nucleic acid
PT sequence in sample, has specific formula.
XX
PS Example 5; Page 33; 40pp; English.
XX
CC The invention describes a novel fluorescent dye and method of detecting
CC nucleic acid. The dye and method are useful for nucleic acid probes for
CC measuring nucleic acid(s) containing a specific nucleic acid sequence in
CC a sample, and for qualitative/quantitative assay of target RNA containing
CC specific base sequence anticipated in gene mixture. The assay is useful
CC in gene diagnosis and other areas of clinical diagnostics and in
CC identification/quantification microorganisms in biological samples such
CC as serum, plasma and urine, microbially contaminated samples from food,
CC rooms, soil, rivers and sea. The fluorescent intercalative dye shows a
CC large fluorescent enhancement upon intercalation into double-stranded
CC nucleic acid, and shows a great difference between excitation and
CC emission wavelengths (has a large Stokes shift) and does not have a
CC fluorescent spectrum that overlaps with those of conventionally known
CC fluorescent intercalation dyes. Viruses, microbial RNAs, specific
CC sequences in one RNA, are detected or quantified in a short time, hence
CC the detection method is applicable to clinical diagnosis which requires
CC high reliability. Amplification and extraction efficiencies of the target
CC nucleic acid, are checked. This sequence represents a synthetic DNA used
CC as the target in an assay to detect double stranded DNA

XX
PT Synthetic nucleic acid probes - comprising two nucleic acid sequences
PT linked by a scissile linkage.
XX
PS Example; p29; 46pp; English.
XX
CC The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and
CC NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile
CC linkage; n= 1 or 1,000, which is used for the detection of specific DNA
CC or RNA sequences in a test soln. The scissile link probes may be PL
CC (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid
CC Support). The differential liability of DNA and RNA may be exploited in a
CC heterogeneous system when the scissile linkage is an RNA molecule. In the
CC examples, counter probe molecules 9 through 16 were used to determine
CC suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
CC OS field.)

XX
XX Detecting target nucleic acid molecules - using excess complementary
XX nucleic acid probes and nicking to complete a cycling sequence.
XX Disclosure; Page 24; 34pp; English.
XX
XX Probe MRCO68 is bound by a hydrolysable linkage to a solid support at its
XX 3' end. It is used by reacting excess probe with a target nucleic acid;
XX nicking hybridised probe at least once within a predetermined sequence to
XX form 2 or more probe fragments hybridised to the target sequence, which
XX results in the probe fragments becoming hybridised to another probe; and
XX identifying probe fragments, so detecting the target sequence. The probe
XX can react with target sequence to complete a cycling sequence. Using this
XX system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
XX be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
XX RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

XX
XX Detecting a label comprising employing (as the label) a reagent having a
XX 3' extendable terminus hybridized to a tandem repeat template in
XX combination with a DNA polymerase and dNTPs necessary for repetitively
XX replicating the tandem repeat.
XX
XX Example; SEQ ID NO 2; 38pp; English.
XX
XX The invention relates to a method for detecting a label, comprising
XX employing (as the label) a reagent having a 3' extendable terminus
XX hybridised to a tandem repeat template in combination with a DNA
XX polymerase and dNTPs necessary for repetitively replicating the tandem
XX repeat. The method involves detecting a binding event between the first and
XX second binding members, employing a label to determine the occurrence of
XX the binding event. The tandem repeating units are polyT. The method of
XX the invention is useful in detecting an analyte using repetitive
XX extension along a tandem repeat. The extended nucleic acid may be used
XX for detecting a moiety, particularly involved in a binding event
XX employing a reagent. The current sequence represents a template member
XX oligonucleotide containing a polyT tandem repeat that binds to the
XX extendable oligonucleotide given in ADC33444.

XX
```

CC This invention relates to a kit for the detection and typing of small
CC round structured virus (SRSV) strains. The kit contains antibodies
CC directed against peptides represented in sequences AAB49700 - AAB49710,
CC which are each SRSV strain specific. Polynucleotide sequences AAF20141 -
CC AAF20151 represent cDNA encoding the strain specific proteins. The kit is
CC used for detecting and typing strains of SRSV in order to prevent the
CC spread of infection and to examine the epidemiology of outbreaks. PCR
CC primers AAF29152 - AAF29163 are used to amplify SRSV strain specific cDNA
CC sequences

XX Polymerase chain reaction and primers for detecting nucleic acids from
PT the diabetogenic coxsackie B virus-4 strain VD2921.

XX Example 5; Page 44; 79pp; English.

XX The invention describes a polymerase chain reaction (PCR) and primers for
CC detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4)
CC strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B,
CC P3C and P3D nucleic acids). The methods and primers are used for the
CC detection of CBV-4 strain VD2921 which is associated with diabetes
CC (diabetogenic enterovirus). Early detection of the diabetes e.g.
CC detection of diabetogenic enteroviral RNA in peripheral mononuclear
CC cells, can improve prognosis by allowing treatment e.g. with antiviral
CC drugs, to prevent further loss of beta cells and severe long term
CC consequences of diabetes including blindness, renal failure and leg
CC amputations. This sequence represents a primer used to determine the
CC genomic structure of diabetogenic coxsackie B virus 4 (CBV-4) strain
CC VD2921

XX PT Detecting target nucleic acid molecules - using excess complementary nucleic acid probes and nicking to complete a cycling sequence.

XX PS Disclosure; Page 24; 34pp; English.

XX CC Probe MRC059 is bound by a hydrolysable linkage to a solid support at its 3' end. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT Composition of matter useful for multi-component analyses, comprises
PT multiple fluorophores bound to molecular scaffold at preset positions to
PT permit fluorescence energy transfer between two fluorophores.
XX
PS Disclosure; Page 43; 113pp; English.
XX
CC This sequence represents a molecular scaffold which may be used in a
CC composition of matter comprising multiple fluorophores. The fluorophores
CC are bound to the molecular scaffold at separate predetermined positions,
CC to permit fluorescence energy transfer between two fluorophores. The
CC fluorophores are characterized by maximum emission wavelength of one
CC being greater than the minimum excitation wavelength of the other. The
CC composition is useful for determining whether a preselected nucleotide
CC residue is present at a predetermined position within a nucleic acid. It
CC is also useful in multicomponent analysis including multiplex biological
CC analysis, and identifying multiple single nucleotide polymorphisms. The
CC presence of a number of given nucleotide residues is determined
CC simultaneously by the composition of the invention

PT Producing sub-population of labeled nucleic acids, useful for analyzing
PT differences in RNA profiles between several different physiological
PT sources, using set of distinct gene specific primers.
XX
PS Example 3; SEQ ID NO 747; 11pp; English.
XX
CC The invention relates to producing a sub-population of labeled nucleic
CC acids (NAs) comprising contacting a NA sample from a physiological
CC source, with a pool of 50 distinct gene specific primers under suitable
CC conditions to enzymatically generate sub-population of NAs, where each
CC gene specific primer has a sequence complementary to a distinct mRNA, and
CC each labeled NA is generated using a single gene specific primer. The
CC method is useful for producing a sub-population of labeled NAs which is
CC useful for analysing the differences in the RNA profiles between several
CC different physiological sources, where the method comprises producing
CC subpopulation of labeled NAs for the different physiological sources,
CC comprising the populations for each physiological source to identify
CC differences in the population, where the comparison is preferably
CC performed by hybridising the labeled NAs for each of the distinct
CC physiological sources to an array of probe NAs stably associated with the
CC surface of a substrate to produce a hybridisation pattern for each of the
CC sources, and comparing the patterns for each of the sources, where
CC differential gene expression assays are utilised in differential
CC expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC tissue, or different tissue or sub-tissue types. The present sequence is a
CC human gene specific PCR primer used in the method of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from USPTO
CC at <http://wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1>

PT New zalphall1 ligand polypeptides and polynucleotides, useful for
PT stimulating proliferation, activation, differentiation and/or induction
PT of inhibition of specialized cell function, or for stimulating an
PT antigenic response.
XX
PS Example 7; Col 139; 105pp; English.
XX
CC The present invention relates to the isolation of a novel cytokine,
CC zalphall1 Ligand and the polynucleotide encoding it. The invention also
CC gives the sequence for the zalphall1 receptor and the polynucleotide
CC encoding it. The zalphall1 Ligand polypeptide stimulates proliferation of
CC natural killer (NK) cells or NK cell progenitors, the activation of NK
CC cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC zalphall1 Ligand polypeptide is also useful in preparing antibodies that
CC bind to zalphall1 Ligand epitopes. The zalphall1 Ligand polynucleotides can
CC be used as probes or primers to clone regions of a zalphall1 Ligand gene,
CC and in gene therapy. Zalphall1 Ligand may also be used to identify
CC inhibitors of its activity, to enhance the generation of anti-tumour
CC responses with or without the infusion of donor lymphocytes, and to
CC activate or stimulate the immune system. The present sequence represents
CC a sequencing primer used to sequence cDNA clones in the isolation of
CC human zalphall1 Ligand

PT Obtaining single stranded polynucleotide tags from a biological sample,
PT for analyzing gene expression or diagnosing clinical conditions,
PT comprises employing nicking endonucleases that cleave complementary
PT strands.
XX
PS Example; Page 294; 302pp; English.
XX
CC The invention relates to a method for obtaining a single stranded
CC polynucleotide tag from a biological sample by cleaving one of the
CC complementary strands of a double stranded polynucleotide with a cleavage
CC agent capable of recognising a double stranded polynucleotide comprising
CC complementary strands and cleaving only one of the strands of the
CC polynucleotide in the process of generating a single stranded
CC polynucleotide tag. The method is useful for separating, analysing,
CC quantifying or obtaining single stranded polynucleotides comprising tags
CC originating partly, and preferably wholly from a source of DNA and/or RNA
CC in a sample comprising biological cells. The method is particularly for
CC analysing gene expression (expression profiling or differential gene
CC expression), or in diagnosing clinical conditions. The present sequence
CC is a primer used in the exemplification of the invention

PT New oligodeoxynucleic acid molecules useful for the preparation of
PT vaccine.
XX

PS Example 8; Page 32; 57pp; English.
XX
CC The present sequence is that of a thiosubstituted oligodeoxynucleic acid
CC (ODN) molecule, ODN 24, including deoxyuridine monophosphates. The
CC invention is based on the discovery that ODNs containing deoxyuridine
CC residues (U-ODNs) have an immunostimulatory effect comparable to, or in
CC many instances greater than, ODNs containing CpG motifs, producing higher
CC numbers of specific T cells to a given antigen. The U-ODNs do not induce
CC the systemic production of pro-inflammatory cytokines and, in contrast to
CC CpG ODNs, are not dependent on a specific motif or a palindromic
CC sequence. Use of a U-ODN for the preparation of a vaccine is claimed.
CC Combining the U-ODN with an antigen strongly increases the potential of
CC the antigen to raise the protection/immune response of a vaccinated
CC individual. An example of the invention demonstrated the generation of a
CC specific immune response against a melanoma-derived peptide (see
CC ABP58360) by injection of mice with the peptide in combination with ODN

PT Improved polymerase thermocycling reaction for nucleic acid
PT amplification, by thermal cycling of promoter-linked nucleic acid
PT template synthesis and in vitro transcriptional amplification of nucleic
PT acid sequences.
XX
PS Example 4; Page 14; 28pp; English.
XX
CC The invention relates to an improved polymerase thermocycling reaction
CC (M1) for linear amplification of nucleic acid sequences, involves
CC denaturing a number of nucleic acid templates (I), combining the
CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC polymerase, contacting P1 with (I) to generate a number of promoter-
CC containing templates, denaturing the promoter-containing templates,

CC contacting P2 with the denatured promoter-containing templates to
CC generate a number of promoter-containing double-stranded DNA templates,
CC where the double-stranded nucleic acid templates are flanked by P1 in one
CC end and P2 in the other end of the other orientation, transcribing the
CC promoter-containing double-stranded DNA templates to form a number of
CC amplified RNA sequences, including the primer region of the promoter-
CC containing double-stranded DNA templates, contacting the amplified RNA
CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC is useful for improved polymerase thermocycling reaction for linear
CC amplification of nucleic acid sequences, and thus for producing mRNA
CC expression profile of a cell by M1 to generate multiple copies of the
CC mRNA. M1 is also useful for determining aberrant protein production of
CC cells in a diseased state, by generating an expression profile by the
CC above method, of cells in both normal and diseased states, comparing the
CC expression profile of the cells in the normal and diseased states,
CC determining the differences in mRNA composition of the cell(s) in the
CC diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC the isolated mRNA by M1, and determining aberrant protein function of the
CC protein coded for by the isolated mRNA. M1 is also useful for treating a
CC cell in a diseased state caused by aberrant protein production, by
CC determining protein expression of a cell in a diseased state, determining
CC the mRNA sequence for the aberrant proteins, synthesising an antisense
CC sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC delivering a pharmaceutically effective dosage of a composition
CC comprising the anti-sense mRNA and a compatible lipid based biological
CC carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC targeted against an aberrant protein, by determining aberrant protein
CC production of cell in a diseased state by the above method, amplifying
CC the aberrant protein by M1 and using recombinant techniques to determine
CC the effect of proposed drug on the aberrant protein. M1 is also useful
CC for differential screening of tissue-specific gene expression at a
CC cellular level, for preparing labeled RNA/DNA probes for a gene chip
CC technology, and for determining the efficacy of a drug regimen against a
CC gene or its cDNAs. The present sequence is an Oligo (dT) primer used to
CC produce second strand cDNA in the method of the invention

DR Stimulating an immune response in a mammal exposed to an antigen or
XX pathogen, useful for enhancing anti-tumor activity resulting in reduced
PT tumor progression or metastasis, comprises administering zalphall ligand
PT polypeptide.
XX Example 7; SEQ ID NO 39; 103pp; English.
PS The invention relates to stimulating an immune response in a mammal
XX exposed to an antigen or pathogen comprises administering a composition
CC comprising mature zalphall ligand polypeptide comprising residues 32-162
CC of ADH44572 in a pharmaceutical vehicle. Also included are stimulating an
CC immune response in a mammal exposed to an antigen or pathogen
CC (comprising: (a) determining (in)directly the level of antigen or
CC pathogen present in the mammal; (b) administering a composition
CC comprising zalphall ligand polypeptide in a pharmaceutical vehicle; (c)
CC determining (in)directly the level of antigen or pathogen in the mammal;
CC and (d) comparing the antigen or pathogen level in (a) with (b), where a
CC change in the level indicates stimulation of immune response), and
CC stimulating an immune response in a mammal exposed to an antigen or
CC pathogen (comprising: (a) determining a level of antigen- or pathogen-
CC specific antibody; (b) administering a composition comprising zalphall
CC ligand polypeptide in a pharmaceutical vehicle; (c) determining a post
CC administration level of the antigen- or pathogen-specific antibody; and
CC (d) comparing the level of the antibody in (a) with (b), where an
CC increase in the antibody level indicates stimulation of immune response).
CC The method is useful for stimulating an immune response in a mammal
CC exposed to an antigen or pathogen, and for enhancing anti-tumour activity
CC resulting in a reduction in tumour progression, decrease in metastasis,
CC or tumour stasis. The tumour may be a haematopoietic tumour, a lymphoma
CC or a B cell tumour. The zalphall ligand is useful for treating a wide
CC range of diseases arising from defects in the immune system, e.g.
CC systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or
CC diabetes, for boosting immunity to infectious diseases, treating
CC immunocompromised patients, such as HIV+ patients and in improving
CC vaccines. The present sequence is a sequencing primer used in the
CC exemplification of the invention.

PT Composition useful for inhibiting the expression of a targeted gene in a
 PT substrate, and for altering a characteristic of a eukaryote, comprises a
 PT DNA-RNA hybrid.
 XX
 PS Example 5; SEQ ID NO 6; 40pp; English.
 XX
 CC The invention describes a composition (I) for inhibiting the expression of
 CC a targeted gene in a substrate, comprising a DNA-RNA hybrid. (I) is
 CC useful for inhibiting the expression of the targeted gene in a substrate.
 CC The substrate is a prokaryote such as a viral or bacterial cell, or
 CC eukaryote or the cell of the eukaryote such as a vertebrate. The
 CC eukaryote is a mouse, rat, chimpanzee, preferably a human being. (I) is
 CC useful for altering the characteristics of an eukaryotic cell. The
 CC characteristic is chosen from expression of a protein, cell division rate
 CC and pigmentation. (I) has an effect that lasts at least three days. (I)
 CC is useful to inhibit the expression of messenger RNA in a cell. The
 CC messenger RNA is transcribed from a gene chosen from viral gene,
 CC oncogene, enzyme. (I) is useful for suppressing cancers, by knocking out
 CC cancer related genes, for preventing and treating microbial infections,
 CC preferably reducing viral pathogenic infection and for reducing the
 CC proliferation of cancer cells. This sequence represents a poly(dT)-26mer
 CC primer used in the creation of DNA-RNA hybrids for controlling gene
 CC expression.

PT Synthetic nucleic acid probes - comprising two nucleic acid sequences
PT linked by a scissile linkage.
XX
PS Example; p29; 46pp; English.
XX
CC The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and
CC NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile
CC linkage; n= 1 or 1,000, which is used for the detection of specific DNA
CC or RNA sequences in a test soln. The scissile link probes may be PL
CC (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid
CC Support). The differential liability of DNA and RNA may be exploited in a
CC heterogenous system when the scissile linkage is an RNA molecule. In the
CC examples, counter probe molecules 9 through 16 were used to determine
CC suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
CC OS field.)

PT Detecting target nucleic acid molecules - using excess complementary
PT nucleic acid probes and nicking to complete a cycling sequence.
XX
PS Disclosure; Page 24; 34pp; English.
XX
CC Probe MRC046 is bound by a permanent linkage to a solid support at its 3'
CC end. It is used by reacting excess probe with a target nucleic acid;
CC nicking hybridised probe at least once within a predetermined sequence to
CC form 2 or more probe fragments hybridised to the target sequence, which
CC results in the probe fragments becoming hybridised to another probe; and
CC identifying probe fragments, so detecting the target sequence. The probe
CC can react with target sequence to complete a cycling sequence. Using this
CC system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

XX
XX Detecting target nucleic acid molecules - using excess complementary
PT nucleic acid probes and nicking to complete a cycling sequence.
XX
PS Disclosure; Page 24; 34pp; English.
XX
CC Probe MRCO71 is bound by a hydrolysable linkage to a solid support at its
CC 3' end. It is used by reacting excess probe with a target nucleic acid;
CC nicking hybridised probe at least once within a predetermined sequence to
CC form 2 or more probe fragments hybridised to the target sequence, which
CC results in the probe fragments becoming hybridised to another probe; and
CC identifying probe fragments, so detecting the target sequence. The probe
CC can react with target sequence to complete a cycling sequence. Using this
CC system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)
CC (Updated on 25-MAR-2003 to correct PR field.)

PT Encoding and sorting in vitro translated proteins, useful for the

PT identification of desired binding partners, comprises attaching a nucleic

PT acid linker to the protein and binding an encoding molecule to the

PT linker.

XX

PS Example 3; Fig 9B; 48pp; English.

XX

CC The sequence represents part of a branched encoding molecule used in

CC methods to hybridise a capture probe to the addressing element of a DNA

CC linker attached to an in vitro translated protein, in order to immobilise

CC the protein to a solid support. The new methods are useful for tagging or

CC encoding in vitro translated proteins with unique and minimal encoding

CC molecules and sorting these molecules onto solid supports. They are also

CC useful for the identification of a desired binding partner. The method

CC allows the use of pre-made sets of universal encoding molecules, such as

CC nucleic acid(s) (analogues). These can be used in conjunction with

CC corresponding universal microarrays or sets of microparticles to create

CC new protein display systems which are flexible, modular, scalable and

CC cost effective. The method allows the use of nucleic acid analogue which

CC are not susceptible to enzymatic incorporation or polymerisation and are

CC superior to conventional DNA/RNA. The proteins can also be labelled with

CC fluorescent groups which can be used to monitor the protein in real time.

CC The absence of RNA is advantageous as they can adopt secondary structures

CC which are difficult to predict and can interfere with hybridisation steps

CC and protein folding/function

PT System for detecting immobilized analyte, useful e.g. for biomedical

PT diagnosis, has as detection agent specific polypeptide coupled to nucleic

PT acid for signal amplification.

XX

PS Example; Page 6; 12pp; German.

XX

CC This invention describes a novel test system (A) which comprises at least

CC one immobilized analyte (I) on an insoluble carrier and a polypeptide

CC detection agent (II), specific for (I) and conjugated, via a linker, to

CC an amplifier (III). (A) is used for direct, in vitro detection of (I)

CC with amplification of the signal by polymerase chain reaction (PCR), or a

CC related technique, applied to (III). The method is useful in biomedical

CC diagnosis and environmental monitoring and can be used to detect a wide

CC range of (I), e.g. diagnostic or pharmaceutical agents, secondary

CC metabolites, herbicides or pesticides. (A) allow simultaneous, parallel

CC detection of many different analytes (high throughput capacity),

CC relatively simply (only a few incubation and washing steps are required)

CC and with high sensitivity and selectivity. This sequence represents

CC primer used in the amplification of the c-myc DNA fragment which encodes

CC an epitope used to illustrate the method of the invention

PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX
PS Claim 9; Page 50; 64pp; German.
XX
CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a prion protein polymorphic microsatellite marker
CC consensus sequence.

XX Selection of specific protein by screening protein-RNA fusions generated
PT in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT with altered properties, potentially useful as catalysts or for therapy
PT or diagnosis.
XX
PS Disclosure; Page 39; 94pp; English.
XX
CC The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC variations were used to generate RNA-protein fusions. These were used in
CC the selection of a specific protein or RNA, by in vitro or in situ
CC translation of candidate RNA molecules to produce RNA-protein fusions,
CC then selecting specific RNA protein fusions. The method is used to select
CC proteins (or DNA encoding them) having altered properties, e.g. for
CC identification of new binding reagents, to identify improved human
CC antibodies or new enzymes. These proteins are potentially useful in
CC diagnosis and therapy, or as industrial catalysts. The methods allow many
CC rounds of selection and amplification to be performed, resulting in
CC enrichment of even very rare molecules and allowing isolation of proteins
CC that bind specifically to almost any compound or catalyze almost any
CC reaction

PT Determining proliferative capacity of cells, useful e.g. for detecting
PT tumor cells, by measuring concentration and subcellular localization of
PT adenomatous polyposis coli protein.
XX
PS Claim 10; Page 13; 26pp; German.
XX
CC This invention describes a novel method for determining the proliferative
CC activity of cells, comprising detecting, in a sample, the concentration
CC and/or subcellular localization of APC (adenomatous polyposis coli)
CC protein (I). The invention also describes (1) determining function of (I)
CC in a sample by detecting presence of the C-terminal, DNA-binding domain
CC of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
CC the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
CC (I) or its fragments by reaction with a probe; (4) double-stranded DNA
CC (II) that contains the sequence GGCGCA 2 3G (S1) and/or GATCCT 2 3GC
CC (S2); (5) peptide fragment of (I) containing at least the DNA-binding
CC domain; (6) antibodies (Ab) directed against an epitope of positions 1340
CC -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
CC one of which is Ab and the other directed against the N-terminal region
CC (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
CC its fragments in a sample consisting of (II), Ab or the set of (7). The
CC method is used to detect proliferative, especially tumor (precursor),
CC cells, to detect function of (I) and mutations in (I), and to purify
CC and/or enrich (I), or its fragments, from a sample. The method allows
CC simple, rapid and reliable detection of proliferation, without the need
CC for polymerase chain reaction or sequencing

XX DR Selective detection of nucleic acids by amplification with labeled
XX PT primers and detection with a trap probe.
XX XX Example 1c; Page 19; 27pp; German.
XX PS This invention describes a novel method for the selective detection of
XX CC nucleic acids which comprises amplification of the nucleic acid with the
XX CC help of labeled primers and detection with a trap probe. The methods and
XX CC reagents are used for the detection of a marker primer and at least 2
XX CC immobilized (or immobilizable) trap probes with the corresponding nucleic
XX CC acid sequence of interest for mutation analysis. The method can be used
XX CC to detect a specific sequence in a sample of one or more nucleic acids by
XX CC using several sets of primers and trap probes (i.e. in an array). The
XX CC methods are useful in molecular biology and diagnostic applications,
XX CC especially for simultaneous detection of multi-pathogens, typing of
XX CC organisms, analyzing genetic diversity and sequencing of genes or
XX CC genomes. This sequence represents a primer used in the method of the
XX CC invention

XX PT reverse transcription and amplification, used to screen for new genes and
XX PT interacting proteins, potential drugs, and for diagnosis.

PS XX Example 1; Page 29; 71pp; English.
CC The invention relates to preparation of a normalised, subdivided library
CC of amplified cDNA from the coding regions of mRNA in a sample. The method
CC involves reverse transcription, with at least one cDNA primer of formula
CC 5'-Con1-dTn2-Vn3-Nn4 to form first stand cDNA where Con1 = any sequence
CC of 1-100 nucleotides; dT = deoxythymidiny1; n2 is at least 1; n3 and n4
CC are both 0, or n3 is 1 and n4 is at least 1; followed by second strand
CC cDNA synthesis using the first strand as template and a second cDNA
CC primer of a similar formula, in the presence of DNA polymerase I (or its
CC Klenow fragment) and amplification of double-stranded cDNA with a set of
CC amplification primers. Comparison of cDNA in the prepared library with a
CC database (a computer-generated list of molecular weights of restricted
CC DNA fragments of known sequence) is used to determine presence of an
CC expressed protein in a cell, also to detect changes in such expression
CC (particularly for diagnosis of disease). Surfaces (chip) having amplified
CC cDNA stably immobilised on it, obtained by a similar method, are used to
CC screen for genes of a particular family, by hybridisation with nucleic
CC acid from the family (to identify new genes) and to detect differences in
CC expression patterns between cells. The polypeptides expressed by the
CC libraries can be used for drug development. Sequences AAV71935 to
CC AAV71946 represent primers used to exemplify the method of the invention

PT Multivalent compounds with at least two binding moieties having
PT specificity for different binding sites on the same target, useful for
PT treating and diagnosing, e.g. angiogenic and hyperproliferative
PT disorders.

Example 6; SEQ ID NO 72; 320pp; English.

The invention relates to a multivalent compound (C) comprising at least two binding moieties having specificity for different binding sites on the same target. (C) is useful for treating euplastic tumour growth and disease associated with angiogenesis or hyperproliferation (claimed). (C) is useful for treating diseases such as arthritis, atherosclerotic plaques, corneal graft neovascularization or ocular diseases. (C) is small and can more easily reach a target. (C) localizes more effectively to the target site than other targeting compounds due to its binding to more than one site on the same target. This sequence represents a DNA oligonucleotide used in the invention.

PT Polynucleotides encoding salivary proteins useful as anti-microbial
PT agents.

PS Example 1; Col 53; 29pp; English.

The invention relates to a polynucleotide derived from the 4ql2-4ql3 region of human chromosome 4 and encoding a zsig63 polypeptide, a secreted salivary protein with anti-microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, skin infections, epithelial wounds, chronic tissue damage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for cDNA encoding human zsig63

PS Example 1; Page 29; 33pp; English.
XX
CC The present invention relates to a new secreted salivary protein, zsig63.
CC The invention is useful for detecting in a test sample, the presence of
CC an antagonist or agonist of zsig63 protein activity. The invention is
CC also useful as an immunogen for producing an antibody to zsig63
CC polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion
CC protein are useful for enhancing in vivo killing of target tissues.
CC Pharmaceutical composition comprising purified zsig63 polypeptide are
CC useful in the treatment of conditions associated with pathological
CC microbes, including bacterial, fungal and viral infections. High
CC expression of zsig63 in salivary gland suggests that anti-microbial
CC polypeptides are useful for treatment of dental caries (tooth decay),
CC periodontal disease, thrush and gastrointestinal disease. Other
CC applications can be used in urinary tract infections, vaginal infections,
CC prevention of infection in skin and other epithelial wounds. The
CC polypeptides can be used to establish normal microflora and protect
CC against pathogenic colonisation and invasion. The invention is useful
CC when pro-inflammatory activity is desired. Applications for such pro-
CC inflammatory activity include the treatment of chronic tissue damage,
CC particularly in areas having a limited or damaged vascular system e.g.,
CC damage in extremities associated with diabetes. Antagonists to zsig63
CC polypeptides may be useful as anti-inflammatory agents. The invention is
CC useful for the treatment of patients having incompetent immune system,
CC such as AIDS (acquired immunodeficiency syndrome) patients or individuals
CC that have undergone chemotherapy, radiation treatment. The invention is
CC also useful for the treatment of lung infections associated with cystic
CC fibrosis and its agonists or antagonists are useful for aiding digestion.
CC The present nucleic acid sequence represents a PCR primer that was used
CC in the methods of the invention for identification of zsig63

PT Novel secreted salivary polypeptide, zsig63, useful as antimicrobial
PT agent for treating microbial infection, dental caries, periodontal
PT disease, thrush gastrointestinal disease, and for aiding digestion.
XX
PS Example 1; Page 29; 33pp; English.
XX
CC The invention relates to human secreted salivary polypeptide designated
CC as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63
CC can be used in detecting agonists and antagonists of its activity, and is
CC also useful as a host defense polypeptide, immune modulating factor,
CC antipathogenic polypeptide, cell-cell signalling molecule, growth factor,
CC cytokine, or as secreted extracellular matrix associated proteins with
CC growth factor hormone activity. It is useful for treating conditions
CC associated with pathological microbes, including bacterial, fungal and
CC viral infections, for treating dental caries (tooth decay), periodontal
CC disease, thrush and gastrointestinal disease, for treating urinary tract
CC infection, vaginal infection and for preventing infection in skin and
CC other epithelial wounds. zsig63 is useful for establishing normal
CC microflora and protect against pathogenic colonisation and invasion, for
CC treating chronic tissue damage e.g. damage in extremities associated with
CC diabetes and useful as anti-inflammatory agents. It is useful as a marker
CC of lung dysfunction, salivary gland dysfunction, or dysfunction of
CC prostate gland. It is also therapeutically useful for aiding digestion.
CC Polynucleotides of the invention are used in gene therapy for increasing
CC or inhibiting zsig63 activity, for detecting abnormalities on human
CC chromosome 4 associated with disease or other human traits and as

CC diagnostics in forensic DNA profiling. Sequences of the invention are
CC useful for stimulating proliferation or differentiation of cardiac
CC myocytes, for proliferation or differentiation of adipocytes and for
CC inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The
CC present sequence is a primer used in the identification of human zsig63
CC DNA

CC a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-
CC 126, 127-219 or 16-219 of zsig63 and an additional protein), using a
CC zsig63 reporter gene construct to identify zsig63 agonists, and producing
CC an anti-zsig63 antibody using zsig63 immunogenic peptides, zsig63 is
CC useful for detecting in a test sample, the presence of antagonist of

CC zsig63 protein activity. Zsig63 has antimicrobial activity and since
CC exhibits high expression in salivary gland, can be used for treating
CC dental carries, periodontal disease, thrush, and gastrointestinal
CC disease, urinary tract infections, vaginal infections, skin infections
CC and other epithelial wounds. The polypeptides can be used to establish
CC normal microflora and protect against pathogenic colonization and
CC invasion. Zsig63 can also be used for providing pro-inflammatory activity
CC for treating chronic, tissue damage particularly in areas having limited
CC or damaged vascular system, e.g. in diabetes, and for treating
CC immunocompromised AIDS patients or in individuals that have undergone
CC chemotherapy, radiation treatment, for treating lung infections e.g. in
CC cystic fibrosis. Detection of zsig63 polypeptide at relatively high
CC levels in the trachea may indicate that such polypeptides may serve as a
CC marker of lung dysfunction. Zsig63 is also useful in diagnosing
CC conditions associated with salivary gland or lung dysfunction including
CC salivary gland carcinoma, Pneumocystis carinii infection, emphysema,
CC chronic bronchitis, prostate dysfunctions such as prostate
CC adenocarcinoma, aiding digestion, and as components of defined cell
CC culture media and may be used to replace serum that is commonly used in
CC culture. The DNA is useful in gene therapy applications to increase or
CC inhibit zsig63 activity, and for detecting abnormalities on human
CC chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,
CC and dentin dysplasia type II). Zsig63 is an adhesin family member. The
CC present sequence is a primer used to isolate and sequence nucleic acids
CC encoding human zsig63

The invention describes a novel non-human transgenic mammal or mammalian
embryo having integrated within its genome, a heterologous nucleotide
sequence comprising at least a significant part of a nucleotide sequence
coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant,
operably linked to a promoter that drives expression of heterologous scce
or its variant in skin. The product of the invention is useful as a model
for the study of disease with the aim of improving treatment, to relieve
or ameliorate a pathogenic condition, for development or testing of a
cosmetic or a pharmaceutical formulation, and for the development of a
diagnostic method. It can also be used as a model for a skin disease or
skin cancer. The invention is also useful for screening or identifying a
compound or composition effective for the prevention or treatment of an
abnormal or unwanted phenotype, and for screening or identifying a
compound or composition effective for the prevention or treatment of
inflammatory skin diseases selected from diseases consisting of epidermal
hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation,
pruritus, atopic dermatitis, eczema, acne and inherited skin diseases
with epidermal hyperkeratosis. The mammal of the invention is also useful
as a model for further studies of itch mechanisms and the testing of
potential compounds and compositions for relieve of various skin diseases
where itch is a component. This sequence represents a 5' RACE cDNA
synthesis primer used in a method of detecting homologues to human
stratum corneum chymotryptic enzyme, SCCE, gene. SCCE is a serine
protease synonymous with human kallikrein 7 (KLK7) and is used in the
development of the transgenic mammals described in the invention

XX Reagent for rapidly detecting or isolating target nucleic acid sequences

PT in polynucleotide-containing sample, comprises capture component and

PT target-specific probe linked to solid substrate.

XX Example 3; Col 17; 24pp; English.

XX The present invention describes a rapid pairing reagent (I) for the

CC isolation or detection of a polynucleotide (PN) analyte molecule having a

CC selected target base sequence, in a sample containing the analyte

CC molecule and non-target polynucleotide, comprising a capture component

CC (A) and a target-specific probe (B) linked to a solid substrate. The

CC isolated sequences are useful for enzymatic amplification. (I) is capable

CC of rapidly binding nucleic acids in the sample and placing them in close

CC proximity to target probes on the reagent, thus enabling binding under

CC low stringency. Combination of rapid capture and concentration of

CC polynucleotides with selective targeting of analyte molecules, greatly

CC enhances the isolation process. Non-ionic morpholino oligomers used as

CC probes are not extended by polymerases and therefore do not interfere

CC with amplification of target molecule. AAA39306 to AAA39316 represent

CC oligonucleotides used in the exemplification of the present invention

XX Attaching capture probes to solid phases through non-nucleic spacers,

PT producing arrays for detecting interactions of proteins with other

PT compounds, e.g. for drug screening.

XX Example 8; Page 29; 57pp; English.

PS The present sequence represents a capture probe specific for a c-myc

XX fusion target. It is used in the method of the invention. The

CC specification describes the use of non-nucleoside spacers to immobilise

CC an array of capture probes on a solid support. The solid support carries

CC an array of capture probes, each consisting of non-nucleoside spacers

CC plus an oligonucleotide to which a nucleic acid-protein fusion or a

CC ribosome display particle is bound. Non-nucleoside spacers prevent

CC interaction of proteins with the support surface, ensuring efficient

CC hybridisation between capture probes and bound nucleic acid/protein

CC fusions, while minimising denaturation of the protein which may then

CC adopt its native folded structure. The arrays of capture probes are used

CC to screen for interactions between proteins and compounds (e.g. other

CC proteins, ligands or nucleic acids), particularly to identify potential

CC therapeutic agents, enzyme substrates or unknown proteins that interact

CC with drugs, but also for diagnosis (detecting disease-associated

CC proteins) and for quantifying target molecules in a sample

DR Preparation of controlled pore glass-polytetrafluoroethylene resin

XX chromatography membrane by heating, calendaring and sintering mixture of

PT controlled pore glass and aqueous dispersion of polytetrafluoroethylene.

XX Example 12; Col 8; 6pp; English.

PS The invention relates to a method of preparing a controlled pore glass-

XX polytetrafluoroethylene (PTFE) resin chromatography membrane, comprising

CC combining controlled pore glass and an aqueous dispersion of PTFE to form

CC a paste-like mass, heating the paste-like mass at 50-70 plus OC,

CC calendaring to form a foldable sheet, and sintering the sheet to produce

CC a rigid, porous sheet. The method prepares a controlled pore glass-PTFE

CC resin chromatography membrane for use in various biotechnical procedures.

CC The membrane is useful in place of controlled pore glass as a support for

CC the synthesis, isolation, and purification of nucleic acids and for the

CC isolation and purification of proteins. The method produces a membrane

CC that may be used in lieu of controlled pore glass. The present sequence

CC represents an oligonucleotide prepared on the membrane in an example

XX which demonstrates the method of the invention

PT      Producing sub-population of labeled nucleic acids, useful for analyzing
PT      differences in RNA profiles between several different physiological
PT      sources, using set of distinct gene specific primers.
XX
PS      Example 3; SEQ ID NO 748; 11pp; English.
XX
CC      The invention relates to producing a sub-population of labeled nucleic
CC      acids (NAs) comprising contacting a NA sample from a physiological
CC      source, with a pool of 50 distinct gene specific primers under suitable
CC      conditions to enzymatically generate sub-population of NAs, where each
CC      gene specific primer has a sequence complementary to a distinct mRNA, and
CC      each labeled NA is generated using a single gene specific primer. The
CC      method is useful for producing a sub-population of labeled NAs which is
CC      useful for analysing the differences in the RNA profiles between several
CC      different physiological sources, where the method comprises producing
CC      subpopulation of labeled NAs for the different physiological sources,
CC      comprising the populations for each physiological source to identify
CC      differences in the population, where the comparison is preferably
CC      performed by hybridising the labeled NAs for each of the distinct
CC      physiological sources to an array of probe NAs stably associated with the
CC      surface of a substrate to produce a hybridisation pattern for each of the
CC      sources, and comparing the patterns for each of the sources, where
CC      differential gene expression assays are utilised in differential
CC      expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC      tissue, or different tissue or sub-tissue types. The present sequence is a
CC      human gene specific PCR primer used in the method of the invention. Note:
CC      The sequence data for this patent did not form part of the printed
CC      specification, but was obtained in electronic format directly from USPTO

CC The invention relates to a method and device for the manufacture of a
CC probe array. The method involves using an inkjet system to discharge a
CC probe solution through a solution discharging head, so as to form a
CC number of probes on a solid matrix. Mists of the probe solution generated
CC during probe solution discharge are caught by an electrostatic adsorption
CC mechanism. The method and device are suitable for manufacturing probe
CC arrays for analysing DNA sequences, and for the simultaneous detection of

CC multiple genes. The method and device of the invention prevent the
CC scattering of probe positions and the mixing of different probe
CC solutions. The present sequence is related to the invention.

XX Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX Claim 9; Page 50; 64pp; German.
PS The invention describes a method of typing (M1) a gene (I) that has one
XX or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a prion protein polymorphic microsatellite marker
CC consensus sequence.

DR Diagnosing non-blood disease such as solid tumor, involves comparing
XX differential expression profile of specific genes in peripheral blood
PT sample of subject with reference expression profile of specific genes.
PT Disclosure; SEQ ID NO 1325; 350pp; English.
PS The invention relate to a method of diagnosing (M1) non-blood disease
XX such as solid tumor by providing peripheral blood sample of human having
CC non-blood disease, and comparing an expression profile of specific genes
CC in the peripheral blood sample to reference expression profile of the
CC genes, where each of the genes is differentially expressed in peripheral
CC blood mononuclear cells (PBMCs) of patients having the disease as
CC compared to PBMCs of normal humans. The method is useful for diagnosing
CC non-blood disease such as solid tumor. The solid tumor is chosen from
CC renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
CC peripheral blood sample comprises enriched PBMCs. The peripheral blood
CC sample is a whole blood sample (claimed). (M1) is useful for identifying
CC genes that are differentially expressed in peripheral blood samples
CC isolated at different stages of progression, development or treatment of
CC RCC and/or other solid tumors. This sequence corresponds to a probe to
CC detect a gene that is differentially expressed and detected by the method
CC of the invention.

XX Diagnosing non-blood disease such as solid tumor, involves comparing
PT differential expression profile of specific genes in peripheral blood
PT sample of subject with reference expression profile of specific genes.
XX
PS Disclosure; SEQ ID NO 1321; 350pp; English.
XX
CC The invention relate to a method of diagnosing (M1) non-blood disease
CC such as solid tumor by providing peripheral blood sample of human having
CC non-blood disease, and comparing an expression profile of specific genes
CC in the peripheral blood sample to reference expression profile of the
CC genes, where each of the genes is differentially expressed in peripheral
CC blood mononuclear cells (PBMCs) of patients having the disease as
CC compared to PBMCs of normal humans. The method is useful for diagnosing
CC non-blood disease such as solid tumor. The solid tumor is chosen from
CC renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
CC peripheral blood sample comprises enriched PBMCs. The peripheral blood
CC sample is a whole blood sample (claimed). (M1) is useful for identifying
CC genes that are differentially expressed in peripheral blood samples
CC isolated at different stages of progression, development or treatment of
CC RCC and/or other solid tumors. This sequence corresponds to a probe to
CC detect a gene that is differentially expressed and detected by the method
CC of the invention.

XX
XX Diagnosing non-blood disease such as solid tumor, involves comparing
PT differential expression profile of specific genes in peripheral blood
PT sample of subject with reference expression profile of specific genes.
XX
PS Disclosure; SEQ ID NO 1327; 350pp; English.
XX
CC The invention relate to a method of diagnosing (M1) non-blood disease
CC such as solid tumor by providing peripheral blood sample of human having
CC non-blood disease, and comparing an expression profile of specific genes
CC in the peripheral blood sample to reference expression profile of the
CC genes, where each of the genes is differentially expressed in peripheral
CC blood mononuclear cells (PBMCs) of patients having the disease as
CC compared to PBMCs of normal humans. The method is useful for diagnosing
CC non-blood disease such as solid tumor. The solid tumor is chosen from
CC renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
CC peripheral blood sample comprises enriched PBMCs. The peripheral blood
CC sample is a whole blood sample (claimed). (M1) is useful for identifying
CC genes that are differentially expressed in peripheral blood samples
CC isolated at different stages of progression, development or treatment of
CC RCC and/or other solid tumors. This sequence corresponds to a probe to
CC detect a gene that is differentially expressed and detected by the method
CC of the invention.

PT PA153 cDNA transcribed from pancreatic tissue.
XX
PS Example 2; Page 121; 123pp; English.
XX
CC This invention describes novel contiguous and partially overlapping cDNA
CC sequences and their encoded polypeptides, designated PA153, transcribed
CC from human pancreatic tissue and which have cytostatic activity. The
CC PA153 polynucleotides, proteins and antibodies are all useful in methods
CC of detection. Detection of PA153 polynucleotide, antigens or anti-PA153
CC antibodies in a sample is indicative of pancreatic disease. PA153

CC antibodies (antagonists) can also be used in vivo for therapeutic use,
CC e.g. treatment of pancreatic disease, tumours or metastases. Antisense
CC PA153 polynucleotides can be used in gene therapy of pancreatic diseases.

PT encoding it, for detecting human chromosomal abnormalities, identifying
PT modulators and treating inflammatory and cardiovascular diseases.

XX Example 1C; Page 118; 122pp; English.

PS
XX The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA
CC and its corresponding protein. Zcytor13 protein is used to promote wound
CC healing in tissues, to exhibit anti-bacterial and anti-viral effects and
CC to identify modulators (e.g. agonists or antagonists). Zcytor13, its
CC agonists or antagonists are useful in the treatment of inflammatory heart
CC or cardiovascular conditions, muscle inflammation, inflammation during
CC and after surgery, arthritis, asthma, inflammatory bowel disease or
CC diverticulitis, for modulating spermatogenesis, sperm capacitation, as
CC immunocontraceptive or anti-fertility vaccine and for treating male
CC infertility. Zcytor13 protein and its antibodies are used to diagnose
CC cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13
CC proteins are used to enhance fertilisation. Zcytor13 antagonists are used
CC to treat myocarditis, atherosclerosis, pelvic inflammatory disease (PID),
CC psoriasis, eczema, scleroderma and other inflammatory diseases. Zcytor13
CC sequences and/or its antibodies are useful for treatment of disorders

CC associated with vasoconstriction, heart arrhythmia, congestive heart
CC disease, muscle spasms and fatigue. They are used for detecting human
CC chromosomal abnormalities. Zcytor13 cDNAs are used in gene therapy.
CC Zcytor13-cytokine fusion proteins or antibody-cytokine fusion proteins
CC are useful for enhancing in vivo killing of target tissue. The present
CC sequence is a polyA PCR primer, ZC7764b which is used to isolate full
CC length zcytor13 cDNA by screening human placental cDNA library

CC The present invention relates to a new secreted salivary protein, zsig63.
CC The invention is useful for detecting in a test sample, the presence of
CC an antagonist or agonist of zsig63 protein activity. The invention is
CC also useful as an immunogen for producing an antibody to zsig63.
CC polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion
CC protein are useful for enhancing in vivo killing of target tissues.
CC Pharmaceutical composition comprising purified zsig63 polypeptide are
CC useful in the treatment of conditions associated with pathological
CC microbes, including bacterial, fungal and viral infections. High
CC expression of zsig63 in salivary gland suggests that anti-microbial
CC polypeptides are useful for treatment of dental caries (tooth decay),
CC periodontal disease, thrush and gastrointestinal disease. Other
CC applications can be used in urinary tract infections, vaginal infections,
CC prevention of infection in skin and other epithelial wounds. The
CC polypeptides can be used to establish normal microflora and protect
CC against pathogenic colonisation and invasion. The invention is useful
CC when pro-inflammatory activity is desired. Applications for such pro-
CC inflammatory activity include the treatment of chronic tissue damage,
CC particularly in areas having a limited or damaged vascular system e.g.,
CC damage in extremities associated with diabetes. Antagonists to zsig63
CC polypeptides may be useful as anti-inflammatory agents. The invention is

CC useful for the treatment of patients having incompetent immune system,
CC such as AIDS (acquired immunodeficiency syndrome) patients or individuals
CC that have undergone chemotherapy, radiation treatment. The invention is
CC also useful for the treatment of lung infections associated with cystic
CC fibrosis and its agonists or antagonists are useful for aiding digestion.
CC The present nucleic acid sequence represents a PCR primer that was used
CC in the methods of the invention for identification of zsig63

Novel secreted salivary polypeptide, zsig63, useful as antimicrobial
agent for treating microbial infection, dental caries, periodontal
disease, thrush gastrointestinal disease, and for aiding digestion.

Example 1; Page 30; 33pp; English.

The invention relates to human secreted salivary polypeptide designated
as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63
can be used in detecting agonists and antagonists of its activity, and is
also useful as a host defense polypeptide, immune modulating factor,
antipathogenic polypeptide, cell-cell signalling molecule, growth factor,
cytokine, or as secreted extracellular matrix associated proteins with
growth factor hormone activity. It is useful for treating conditions
associated with pathological microbes, including bacterial, fungal and
viral infections, for treating dental caries (tooth decay), periodontal
disease, thrush and gastrointestinal disease, for treating urinary tract
infection, vaginal infection and for preventing infection in skin and

CC other epithelial wounds. zsig63 is useful for establishing normal
CC microflora and protect against pathogenic colonisation and invasion, for
CC treating chronic tissue damage e.g. damage in extremities associated with
CC diabetes and useful as anti-inflammatory agents. It is useful as a marker
CC of lung dysfunction, salivary gland dysfunction, or dysfunction of
CC prostate gland. It is also therapeutically useful for aiding digestion.
CC Polynucleotides of the invention are used in gene therapy for increasing
CC or inhibiting zsig63 activity, for detecting abnormalities on human
CC chromosome 4 associated with disease or other human traits and as
CC diagnostics in forensic DNA profiling. Sequences of the invention are
CC useful for stimulating proliferation or differentiation of cardiac
CC myocytes, for proliferation or differentiation of adipocytes and for
CC inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The
CC present sequence is a primer used in the identification of human zsig63
CC DNA

XX
CC The present invention relates to the isolation of a novel cytokine,
CC zalphall1 Ligand and the polynucleotide encoding it. The invention also
CC gives the sequence for the zalphall1 receptor and the polynucleotide
CC encoding it. The zalphall1 Ligand polypeptide stimulates proliferation of
CC natural killer (NK) cells or NK cell progenitors, the activation of NK

CC cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC zalphall1 Ligand polypeptide is also useful in preparing antibodies that
CC bind to zalphall1 Ligand epitopes. The zalphall1 Ligand polynucleotides can
CC be used as probes or primers to clone regions of a zalphall1 Ligand gene,
CC and in gene therapy. Zalphall1 Ligand may also be used to identify
CC inhibitors of its activity, to enhance the generation of anti-tumour
CC responses with or without the infusion of donor lymphocytes, and to
CC activate or stimulate the immune system. The present sequence represents
CC a sequencing primer used to sequence cDNA clones in the isolation of
CC human zalphall1 Ligand

PT Novel isolated zsig63 polypeptide, member of the adhesin family, useful
PT for treating dental carries, periodontal disease, thrush,
PT gastrointestinal disease, urinary tract infections, vaginal infections,
PT skin infections.
XX
PS Example 1; Page 29; 32pp; English.
XX
CC The invention relates to an isolated zsig63 polypeptide comprising at
CC least 90% identity to an amino acid sequence which comprises domain 1 of
CC zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also
CC included are the polynucleotide encoding zsig63, a zsig63 expression

CC vector, a cultured cell comprising the vector and expressing the protein,
CC a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-
CC 126, 127-219 of zsig63 and an additional protein), using a
CC zsig63 reporter gene construct to identify zsig63 agonists, and producing
CC an anti-zsig63 antibody using zsig63 immunogenic peptides, and producing
CC useful for detecting in a test sample, the presence of antagonist of
CC zsig63 protein activity. Zsig63 has antimicrobial activity and since
CC exhibits high expression in salivary gland, can be used for treating
CC dental carries, periodontal disease, thrush, and gastrointestinal
CC disease, urinary tract infections, vaginal infections, skin infections
CC and other epithelial wounds. The polypeptides can be used to establish
CC normal microflora and protect against pathogenic colonization and
CC invasion. Zsig63 can also be used for providing pro-inflammatory activity
CC for treating chronic, tissue damage particularly in areas having limited
CC or damaged vascular system, e.g. in diabetes, and for treating
CC immunocompromised AIDS patients or in individuals that have undergone
CC chemotherapy, radiation treatment, for treating lung infections e.g. in
CC cystic fibrosis. Detection of zsig63 polypeptide at relatively high
CC levels in the trachea may indicate that such polypeptides may serve as a
CC marker of lung dysfunction. Zsig63 is also useful in diagnosing
CC conditions associated with salivary gland or lung dysfunction including
CC salivary gland carcinoma, Pneumocystis carinii infection, emphysema,
CC chronic bronchitis, prostate dysfunctions such as prostate
CC adenocarcinoma, aiding digestion, and as components of defined cell
CC culture media and may be used to replace serum that is commonly used in
CC culture. The DNA is useful in gene therapy applications to increase or
CC inhibit zsig63 activity, and for detecting abnormalities on human
CC chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,
CC and dentin dysplasia type II). Zsig63 is an adhesin family member. The
CC present sequence is a primer used to isolate and sequence nucleic acids
CC encoding human zsig63

PT Stimulating an immune response in a mammal exposed to an antigen or
PT pathogen, useful for enhancing anti-tumor activity resulting in reduced
PT tumor progression or metastasis, comprises administering zalphall ligand
PT polypeptide.

XX Example 7; SEQ ID NO 38; 103pp; English.

XX The invention relates to stimulating an immune response in a mammal
CC exposed to an antigen or pathogen comprises administering a composition
CC comprising mature zalphall ligand polypeptide comprising residues 32-162
CC of ADH44572 in a pharmaceutical vehicle. Also included are stimulating an
CC immune response in a mammal exposed to an antigen or pathogen
CC (comprising: (a) determining (in)directly the level of antigen or
CC pathogen present in the mammal; (b) administering a composition
CC comprising zalphall ligand polypeptide in a pharmaceutical vehicle; (c)
CC determining (in)directly the level of antigen or pathogen in the mammal;
CC and (d) comparing the antigen or pathogen level in (a) with (b), where a
CC change in the level indicates stimulation of immune response), and
CC stimulating an immune response in a mammal exposed to an antigen or
CC pathogen (comprising: (a) determining a level of antigen- or pathogen-
CC specific antibody; (b) administering a composition comprising zalphall
CC ligand polypeptide in a pharmaceutical vehicle; (c) determining a post
CC administration level of the antigen- or pathogen-specific antibody; and
CC (d) comparing the level of the antibody in (a) with (b), where an
CC increase in the antibody level indicates stimulation of immune response).
CC The method is useful for stimulating an immune response in a mammal
CC exposed to an antigen or pathogen, and for enhancing anti-tumour activity
CC resulting in a reduction in tumour progression, decrease in metastasis,
CC or tumour stasis. The tumour may be a haematopoietic tumour, a lymphoma
CC or a B cell tumour. The zalphall ligand is useful for treating a wide
CC range of diseases arising from defects in the immune system, e.g.
CC systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or
CC diabetes, for boosting immunity to infectious diseases, treating
CC immunocompromised patients, such as HIV+ patients and in improving
CC vaccines. The present sequence is a sequencing primer used in the
CC exemplification of the invention.

PT treating cancer, e.g. melanoma, solid tumor, hematopoietic tumor, or
PT lymphoma.
XX
PS Example 7; SEQ ID NO 38; 111pp; English.

XX The invention describes an isolated polypeptide comprising a sequence of
CC amino acid residues that is at least 90 or 95% identical to residues 41
CC (Gln) to 148 (Ile), or 32 (Gln) to 148 (Ile) of a sequence of 162 amino
CC acids (SEQ ID NO:2, human zalphall1 ligand), fully defined in the
CC specification. Also described are: a pharmaceutical composition
CC comprising the polypeptide, and a vehicle; a method of treating cancer in
CC a mammal; a method of stimulating an immune response in a mammal bearing
CC melanoma; a method of stimulating an immune response in a mammal bearing
CC a tumour; an isolated polynucleotide comprising a sequence of nucleotides
CC that encode amino acid residues cited above, where the polynucleotide
CC encodes a polypeptide that binds a receptor comprising 538 amino acids,
CC fully defined in the specification; a pharmaceutical composition
CC comprising the polynucleotide encoding, in a pharmaceutically acceptable
CC vehicle; an expression vector comprising the following operably linked
CC elements a control element; and a DNA segment comprising the
CC polynucleotide; and an isolated polynucleotide molecule comprising at
CC least 10 nucleotides of the polynucleotide sequence of 642 bp, fully
CC defined in the specification. The molecules, compositions and methods are
CC useful for treating cancer, e.g. melanoma, solid tumour, haematopoietic
CC tumour, or lymphoma. This sequence represents a primer used in the
CC expression cloning of human cytokine zalphall1 ligand.

PT Novel substantially pure androgen receptor (AR) complex-associated
PT protein which binds to AR and increases ability of AR to transactivate
PT androgen-responsive gene, useful as drug target for treating liver
PT cancer.
XX
PS Example; Page 11; 26pp; English.
XX
CC The invention relates to an androgen receptor complex-associated protein
CC (ARCAP) sequence and the cDNA encoding it. The protein is useful for

CC screening a compound that decreases AR-mediated (androgen receptor
CC mediated) transactivation which involves contacting the ARCAP protein
CC with a protein complex comprising an AR in the presence of a candidate
CC compound, measuring the extent of binding between the polypeptide, and
CC determining if the extent of binding is less than the extent of binding
CC between the polypeptide and the protein complex in the absence of the
CC candidate compound. The ARCAP DNA is useful for determining if a sample
CC contains cancerous cells which involves providing a sample from a human
CC patient and detecting ARCAP expression in the sample. The sequences are
CC useful for determining whether a sample contains liver tumour cells. This
CC sequence represents a 5'RACE PCR primer used to amplify human ARCAP DNA

Novel substantially pure androgen receptor (AR) complex-associated
protein which binds to AR and increases ability of AR to transactivate
androgen-responsive gene, useful as drug target for treating liver
cancer.
Example; Page 15; 18pp; Japanese.
The present invention relates to the isolation of human androgen receptor
complex-coupled protein (ARCAP), and the polynucleotide sequence encoding
it. The ARCAP polypeptide complexes with an androgen receptor to increase
the activity of the androgen receptor, transactivating the androgen
responding gene. The invention also describes a vector containing the
ARCAP polynucleotide sequence, and a host cell containing the ARCAP
polynucleotide sequence. The ARCAP polypeptide can be used as a treating
agent. The present sequence represents a PCR primer used in the example
of the present invention

PT Analyzing repeat sequences in DNA using a probe which hybridizes to
PT adjacent repetitive and non-repetitive regions and determining hybrid
PT melting point is useful to detect microsatellite instability such as in
PT hereditary cancer.

Claim 16; Page 7; 19pp; English.
The present invention relates to a method for analysing a target nucleic
acid consisting of repetitive and non-repetitive sequences. The method
comprises hybridising a polynucleotide probe comprising a segment
complementary to a non-repetitive region and a segment complementary to
an adjacent repetitive region, where the second segment consists of a
defined number of repeats, and determining the melting point temperature
of the hybrid. The method is used to analyse microsatellites, especially
microsatellite instability, particularly as a means for detecting
hereditary tumours. Alternatively, the method is used to identify an
individual in a population. The present sequence is a probe for
Mononucleotide repeat locus BAT25, and was used to illustrate the
invention

PT Synthesis of branched polymers and novel branched polymeric structures -
PT used as molecular probes esp. for detecting poly-nucleotide(s).
XX
PS Example 8; Page 33; 52pp; English.
XX
CC The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the
CC construction of an oligonucleotide clamp. The clamp is a comb-type
CC branched polymer which has 3' termini and was used to bind a target
CC sequence comprising a segment of the HIV pol and nef genes in single
CC stranded or double stranded forms. An oligonucleotide clamp is a compound
CC capable of forming a covalently closed macromolecule or a stable circular
CC complex after specifically binding to the target polynucleotide.
CC Oligonucleotide clamps generally comprise one or more oligonucleotide
CC moieties capable of specific binding to the target molecule and one or
CC more pairs of binding moieties covalently linked to the oligonucleotide
CC moieties. Upon annealing of the oligonucleotides moieties to the target
CC polynucleotide, the binding moieties of a pair are bought into
CC juxtaposition so that they form a stable covalent or non-covalent linkage
CC or complex. The interaction of the binding moieties effectively clamps
CC the specifically annealed oligonucleotide moieties to the target
CC polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

XX Jarvik JW;
XX WPI; 2001-514778/56.
XX Transcript, genetic, and especially nucleic acid sequence analysis
PT comprises analysis of hybrid peptide products.
XX
PS Example 11; Page 30; 48pp; English.
XX
CC The invention relates to a method of peptide-based transcript or genetic
CC analysis comprising: (a) providing multiple polynucleotides (I) derived
CC from mRNAs from a biological sample, where (I) has homology to a known
CC reference sequence (II); (b) expressing (I); and (c) assessing a physical
CC property of the expression products to determine the sequences of (I) by
CC comparison with the predicted properties of polypeptides encoded by (II).
CC The method is useful for transcript or genetic analysis, especially
CC nucleic acid analysis where the method comprises expressing polypeptides
CC from two or more reading frames and determining the masses to create a
CC peptide mass signature characteristic of the nucleic acid molecule. The
CC peptide is considerably smaller than the DNA molecule that encodes it
CC (individual amino acids averages about 110 Daltons each whereas the
CC trinucleotides (triplets) that encode them average N Daltons each). Also,
CC the peptides are much more diverse in composition than nucleic acids, as
CC they are composed of combinations of 20 different amino acids instead of
CC combinations of 4 different nucleotides, e.g., two random DNA fragments
CC of identical composition (e.g., with 10 adenines, 10 thymines, 15
CC guanines, and 15 cytosines) are extremely unlikely to encode peptides of
CC identical composition. This means that whereas the two nucleic acids have
CC identical masses and cannot be distinguished on the basis of mass, the
CC peptides that they encode will, except in statistically very rare cases,
CC have different masses and can be readily distinguished in the basis of
CC mass. The present sequence represents the coding sequence of human
CC haemoglobin alpha 2 transcript (extreme 3' end) used in an example to
CC demonstrate the method of the invention

PT Determining proliferative capacity of cells, useful e.g. for detecting
PT tumor cells, by measuring concentration and subcellular localization of
XX adenomatous polyposis coli protein.
PS Claim 10; Page 12; 26pp; German.
XX
CC This invention describes a novel method for determining the proliferative
CC activity of cells, comprising detecting, in a sample, the concentration
CC and/or subcellular localization of APC (adenomatous polyposis coli)
CC protein (I). The invention also describes (1) determining function of (I)
CC in a sample by detecting presence of the C-terminal, DNA-binding domain
CC of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
CC the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
CC (I) or its fragments by reaction with a probe; (4) double-stranded DNA
CC (II) that contains the sequence GCGCGCA_2_3G (S1) and/or GATCCT 2 3GC
CC (S2); (5) peptide fragment of (I) containing at least the DNA-binding
CC domain; (6) antibodies (Ab) directed against an epitope of positions 1340
CC -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
CC one of which is Ab and the other directed against the N-terminal region
CC (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
CC its fragments in a sample consisting of (II), Ab or the set of (7). The
CC method is used to detect proliferative, especially tumor (precursor),
CC cells, to detect function of (I) and mutations in (I), and to purify
CC and/or enrich (I), or its fragments, from a sample. The method allows
CC simple, rapid and reliable detection of proliferation, without the need
CC for polymerase chain reaction or sequencing

Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.

Example; Col 717; 588pp; English.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Friedreich's ataxia, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

PT sequence which is catalytically active in presence of analyte, contacting
PT catalytic nucleic acid with substrate and amplifying catalytic product.
XX
PS Disclosure; Page; 36pp; English.

The invention relates to a method of detecting an analyte in a sample. The method comprises providing a nucleic acid sequence which is initially catalytically inactive, but which becomes catalytically active in the presence of an analyte (the effector); providing a nucleic acid substrate for the catalytic activity of the nucleic acid sequence; and contacting the nucleic acid sequence and the substrate with the sample under conditions allowing catalytic activity of nucleic acid sequences. The catalytic nucleic acid sequence will be able to convert the nucleic acid substrate into a nucleic acid product only if the analyte of interest is present. The nucleic acid catalytic product is then amplified, and a significant increase in the amount of product indicates the presence of the analyte in the sample. The method is useful for the qualitative or quantitative determination of an analyte in a sample in diagnostic assays. The invention describes the in vitro selection of a ribozyme ligase (L1; AAA57859, AAA57860) which is catalytically active only in the presence of an oligonucleotide effector (AAA57854). The L1 ribozyme ligase was selected from a pool of RNA molecules comprising a central randomised region 90 nucleotides in length flanked on both sides by constant sequence regions (the N90 RNA pool; AAA57851). In the presence of the effector, selection was performed using one of the tagged substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e., those which have become ligated to the substrate molecule) were reverse transcribed using the effector oligo, and then PCR amplified using the effector and a DNA primer identical in sequence to the substrate used for the selection. A ribozyme ligase, L1, was selected via this procedure. L1 can only adopt its active conformation (AAA57859) in the presence of the effector oligo (analyte). In the absence of the effector, L1 adopts an inactive conformation (AAA57860). The present sequence represents the deoxy-T22-tagged substrate oligonucleotide. The dr22 tag enables successfully ligated products to be isolated using oligo(dA) cellulose Type 7. Note: The present sequence is not given in the specification, but is created from the information given on page 11

PT Synthesizing RNA oligonucleotide involves combining single-stranded

PT circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT enzyme to yield desired RNA complementary to circular oligonucleotide
PT template.
XX
PS Example 2; SEQ ID NO 6; 78pp; English.
XX
CC The invention relates to a method for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template with at least two types of ribonucleotide
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC oligonucleotide multimer complementary to the circular oligonucleotide
CC template, where the RNA oligonucleotide multimer comprises multiple
CC copies of the desired RNA oligonucleotide. The method is useful for
CC synthesising an RNA oligonucleotide with well-defined ends. The circular
CC oligonucleotide is introduced into the cell using direct injection,
CC electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC cation-mediated delivery. The method is useful for treating bacterial
CC and/or viral infections in mammals, particularly drug resistant
CC infections, and for producing double stranded DNA oligomers. The method
CC is performed in the absence of an oligonucleotide primer, or without the
CC addition of auxiliary proteins. This sequence represents an
CC oligonucleotide used in the method of the invention.

PT Detection of multiple analytes, e.g. ligands, receptors, polynucleotides
PT and pollutants, involves adding a combination of sensitizer reagents and
PT reactive reagent Actuatable by a product of the sensitizer reagents.
XX
PS Example; Page 58; 87pp; English.
XX
CC The invention relates to the detection of multiple components in a
CC medium, comprising combining the medium with at least two sensitizer
CC reagents, and at least one reactive reagent activated by a product
CC generated by the sensitizer reagents when activated; and differentially
CC activating the sensitizer reagents. The combination of sensitizer
CC reagents and reactive reagent(s) allows differential detection of the
CC components. Methods of the invention may be used for the detection of
CC ligands, receptors and polynucleotides, and also for the detection of
CC e.g. cells, various drugs, metabolites, pesticides (e.g. polyhalogenated
CC biphenyls, phosphate esters, thiophosphates, carbamates and
CC polyhalogenated sulfenamides) and pollutants. Methods of the invention
CC allow the detection of multiple analytes in a single test medium. An
CC application of the methods of the present invention would be in the field
CC of clinical diagnostics. The current sequence represents A24
CC oligonucleotide for the creation of oligonucleotide coated phthalocyanine
CC sensitizer particles (Pc-A24)

PS Characterizing cellular activity of compound, by receiving images of
XX cells with known activity and images of cells treated with compound,
PT characterizing phenotypic attributes of images and comparing the
PT phenotypes.
XX
PS Disclosure; Fig 18; 139pp; English.
XX
CC This invention relates to a novel method for the characterisation of the
CC activity of a compound on cell. The method involves receiving images of
CC cells with a cellular activity and images of other cells treated with the
CC compound, quantitatively characterising phenotypic attributes of the
CC image of cells with a cellular activity to produce a target phenotype for
CC the cellular activity and that of the image of other cells to produce a
CC second phenotype for the compound, and comparing the two phenotypes to
CC determine whether the compound possesses cellular activity. The invention
CC may be useful for characterising cellular activity of a compound, for
CC determining information about properties of substances based upon the
CC information about structure of living or non-living cells exposed to
CC substances. The invention is also useful for identifying promising
CC candidates in a search for new and better medicines and treatments using
CC multiple biological descriptors from a single cell markers or components.

XX Identifying a candidate polymorphic repeat within a coding sequence, for
PT understanding or treating genetic disease, comprises detecting tandem
PT repeats in a target coding sequence and scoring the repeats for
PT polymorphic probability.
XX
PS Example; Col 579; 588pp; English.
XX
CC The invention discloses a method for identifying a candidate polymorphic
CC repeat within a coding sequence (expressed sequence tag, EST), which
CC comprises detecting tandem repeats in a target coding sequence, scoring
CC the repeats for polymorphic probability and generating a dataset
CC correlating the repeats with polymorphic probability to identify a
CC candidate polymorphic repeat. The computational methods (polymorphic
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC useful for identifying and detecting candidate polymorphic repeats in
CC human genes, which can be used to understand, treat or eliminate genetic
CC diseases, predispositions or adverse drug-treatment reactions. Examples
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC the polymorphic repeats identified for a search of human ESTs

XX New immunostimulatory nucleic acid, useful for preparing a composition
PT for treating an allergic condition.
XX
PS Example 1; Page 44; 115pp; English.
XX
CC The present invention describes immunostimulatory nucleic acids of 14-100
CC nucleotides in length comprising the formula 5' X1DCGHX2 3' (I), where X1
CC or X2 = independently any sequence 0-10 nucleotides; D = nucleotide other
CC than C; C = cytosine; G = guanine; H = nucleotide other than G. The
CC immunostimulatory nucleic acid further comprises a sequence consisting of
CC P and N positioned immediately 5' to X1 or 3' to X2 and N is a B cell
CC neutralising sequence, where N begins with a CCG trinucleotide and is at
CC least 10 nucleotides long and P is GC-rich palindrome containing sequence
CC at least 10 nucleotides long. Also described: (1) a pharmaceutical
CC composition comprising the immunostimulatory nucleic acid and a carrier;
CC and (2) treating an allergic condition. (I) has antiallergic activity and
CC can be used in gene therapy. (I) can be used for preparing a composition
CC for treating a variety of immune related disorders such as cancer,
CC infectious diseases and allergic disorders. (I) also stimulates the
CC activation of natural killer cells and the production of type 1
CC interferon (IFN). The present sequence represents an immunostimulatory
CC oligonucleotide, which is used in an example from the present invention

PT Improved polymerase thermocycling reaction for nucleic acid
PT amplification, by thermal cycling of promoter-linked nucleic acid
PT template synthesis and in vitro transcriptional amplification of nucleic
PT acid sequences.
XX
PS Example 7; Page 14; 28pp; English.
XX
CC The invention relates to an improved polymerase thermocycling reaction
CC (M1) for linear amplification of nucleic acid sequences, involves

CC denaturing a number of nucleic acid templates (I), combining the
CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC polymerase, contacting P1 with (I) to generate a number of promoter-
CC containing templates, denaturing the promoter-containing templates to
CC generate a number of promoter-containing double-stranded DNA templates,
CC where the double-stranded nucleic acid templates are flanked by P1 in one
CC end and P2 in the other end of the other orientation, transcribing the
CC promoter-containing double-stranded DNA templates to form a number of
CC amplified RNA sequences, including the primer region of the promoter-
CC containing double-stranded DNA templates, contacting the amplified RNA
CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC is useful for improved polymerase thermocycling reaction for linear
CC amplification of nucleic acid sequences, and thus for producing mRNA
CC expression profile of a cell by M1 to generate multiple copies of the
CC mRNA. M1 is also useful for determining aberrant protein production of
CC cells in a diseased state, by generating an expression profile by the
CC above method, of cells in both normal and diseased states, comparing the
CC expression profile of the cells in the normal and diseased states,
CC determining the differences in mRNA composition of the cell(s) in the
CC diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC the isolated mRNA by M1, and determining aberrant protein function of the
CC protein coded for by the isolated mRNA. M1 is also useful for treating a
CC cell in a diseased state caused by aberrant protein production, by
CC determining protein expression of a cell in a diseased state, determining
CC the mRNA sequence for the aberrant proteins, synthesising an antisense
CC sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC delivering a pharmaceutically effective dosage of a composition
CC comprising the anti-sense mRNA and a compatible lipid based biological
CC carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC targeted against an aberrant protein, by determining aberrant protein
CC production of cell in a diseased state by the above method, amplifying
CC the aberrant protein by M1 and using recombinant techniques to determine
CC the effect of proposed drug on the aberrant protein. M1 is also useful
CC for differential screening of tissue-specific gene expression at a
CC cellular level, for preparing labeled RNA/DNA probes for a gene chip
CC technology, and for determining the efficacy of a drug regimen against a
CC gene or its cDNAs. The present sequence is an Oligo (dT)24 RT-(reverse
CC transcriptase) PCR primer used to produce first strand cDNA in the method
CC of the invention

PT Amplification of nucleic acids, where the promoter is blocked from
PT extension at the 3' end, useful for eliminating multiple step reactions.
XX
PS Disclosure; Fig 2; 9pp; English.
XX

The invention relates to a method of amplification of nucleic acid which
comprises primer extension by reverse transcriptase and hybridising an
oligonucleotide to the single stranded DNA, where the oligonucleotide is
blocked from extension at the 3' end. The method is useful for
amplification of nucleic acids. In the new method, a promoter is
protected from degradation throughout the method. The promoter is
constructed so that it does not serve as a primer for extension of a
sequence that is complementary to the target sequence, i.e. it is
blocked. The method can be combined with other processes to eliminate the
need for multiple steps and varying reaction conditions and their
associated problems. At least three otherwise separate enzymatic
reactions can occur consecutively in one phase (i.e., without organic
extraction and precipitation), more preferably in the same reaction
vessel. Preferably, cDNA synthesis according to the new method may occur
in a modified low salt buffer. The present sequence represents the poly A
tract of a mRNA used to illustrate the method of the invention.

PT Creating recombination products between two distinct nucleotide
PT sequences, useful in the field of synthetic gene technology, and in
PT assembling a library, or a population or a collection of polypeptide
PT variants.
XX
PS Example 3; SEQ ID NO 106; 132pp; English.
XX
CC The present invention describes a method for creating a collection of
CC recombination products between two nucleotide sequences. The method
CC comprises combining an initial set of oligonucleotides corresponding to a
CC first nucleotide sequence with a subsequent set of oligonucleotides
CC corresponding to a distinct nucleotide sequence and further combining the
CC initial and subsequent sets of combination oligonucleotides having a
CC sequence region corresponding to the initial nucleotide sequence and a
CC sequence region corresponding to the second oligonucleotide sequence.
CC Also described is a method of creating a collection of recombination
CC products between two genes. The methods and compositions of the present
CC invention are useful in the field of synthetic gene technology, and more
CC specifically, to generating a collection of recombination products
CC between distinct nucleotide sequences. They can also be used in
CC assembling a library, or a population or a collection of polypeptide
CC variants that correspond to single or multiple polynucleotide

PT Prevention or treatment of gastric ulcer involves administering nucleic acid.
XX
PS Disclosure; Page 14; 45pp; English.
XX
CC The invention relates to a method of prevention or treatment of gastric ulcer comprising administering a nucleic acid to a subject in need for treatment of gastric ulcer. A nucleic acid sample comprising
CC oligonucleotide 2006 was administered to a mouse model by an oral route or a vehicle control. Colonisation of mice by Helicobacter pylori was assessed at time points from 1 day to 1 month after treatment. The ability of the nucleic acid to reduce H. pylori colonisation was assessed. The method is useful for preventing or treating a gastric ulcer on a subject e.g. human or non-human vertebrate animal including dog, cat, horse (equine gastric ulcer syndrome, EGUS), cow, goat, sheep, pig, rabbit, turkey, chicken, primate, rat and mouse. The method effectively treats or prevents gastric ulcers. The present sequence represents an immunostimulatory nucleic acid for the treatment of gastric ulcers

PT New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma.
XX
PS Example 3; SEQ ID NO 19; 139pp; English.
XX
CC This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is the non-CpG DNA oligo IMT 053, used in an exemplification of the invention.

PT New calix(4)arene-nucleoside hybrid useful in gene therapy has at least
PT one nucleoside attached to a calix(4)arene group through amide bonding,
PT and is derived from a calix(4)arene having amino groups.
XX
PS Claim 7; Page 20; 16pp; English.
XX
CC The present sequence is that of a calix(4)arene-oligonucleotide hybrid of
CC the invention, which includes a calix(4)arene-nucleoside (preferably
CC thymidine) derivative. The calix(4)arene-oligonucleotide hybrid functions
CC as a DNA hairpin structure mimic. It effectively recognises DNA or RNA
CC through triplex formation by bonding between the calix(4)arene-containing
CC cavity and a biologically active substance. The hybrid has a certain
CC level of both rigidity and flexibility, is stable in vivo, has high cell
CC permeability and can be mass-produced. It can be used as a DNA sensor or
CC for gene therapy

PT Inserting a nucleic acid into a circular vector comprising joining their
PT ends, melting, and reannealing ends at two different concentrations;
PT useful for cloning small amounts of nucleic acids and forming genomic
PT libraries.
XX
PS Example 3; Page 67; 71pp; English.
XX
CC This invention describes a novel method (M1) for inserting a nucleic acid
CC (N1) into a circular vector (V1) comprising joining ends of N1 and V1
CC under a first nucleic acid concentration, melting hybridized cohesive
CC circularization ends, and reannealing the ends at a second concentration.
CC The methods are useful for the cloning small amounts of nucleic acids and
CC forming genomic libraries of complex populations of DNA or cDNA. The
CC methods allow the cloning of minute amounts of nucleic acids efficiently
CC and avoids the size selection problems of prior art systems. Larger
CC nucleic acid fragments are just as easily cloned, allowing highly
CC representative libraries to be made. Vector to vector ligation is avoided
CC using the methods. AAA40351-A40366 represents primers used to illustrate
CC the method of the invention

XX
CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker, and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
CC protein (PrP) comprising a polymorphic microsatellite locus.

XX New genotyping oligonucleotide, useful for detecting the presence,

PT absence or identity of single polynucleotide polymorphism in a nucleic

PT acid sample.

XX

PS Claim 1; Page 56; 83pp; English.

CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide

CC primer extension (SNPE) primers, and the sequences of regions flanking

CC sites of single nucleotide polymorphisms SNPs. The present invention

CC includes kits for determining the presence or absence of a SNP, using the

CC oligonucleotides of the invention. The PCR primers are used to amplify a

CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.

CC The oligonucleotides are useful for genotyping a nucleic acid sample by

CC performing a single-nucleotide primer extension reaction. The

CC oligonucleotides are useful for determining the presence, absence or

CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to

CC assess by association analysis the genotype of an individual or group of

CC individuals, having a pathological phenotypic trait suspected of being

CC caused by one or more SNPs. Phenotypic traits include diseases e.g.

CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular

CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,

CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic

CC traits also include symptoms of or susceptibility to multifactorial

CC disease of which a component is or may be genetic such as autoimmune

CC diseases, including, rheumatoid arthritis, multiple sclerosis,

CC inflammation, cancer, nervous system diseases and infection by pathogenic

CC microorganism. The method is also useful in forensic investigations and

CC paternity analysis. The present sequence represents a single nucleotide

CC primer extension (SNPE) primer specific for a human SNP containing DNA

CC sequence

PS Example 2; Col 45; 38pp; English.

XX

CC The present sequence represents an oligonucleotide used in an example of

CC the present invention. The present invention describes a method for

CC synthesising a selected oligonucleotide (I) having well defined ends. The

CC method comprises: (a) annealing a primer to a single-stranded (ss)

CC circular template to yield a primed circular template, where the template

CC comprises: (i) at least one nucleotide sequence complementary to (I); and

CC (ii) at least one nucleotide effective to produce a cleavage site in the

CC oligonucleotide multimer; (b) combining the primed circular template with

CC at least two types of nucleotide triphosphates and a polymerase enzyme

CC without the addition of auxiliary proteins to yield a ss oligonucleotide

CC multimer complementary to the circular oligonucleotide template,

CC comprising multiple copies of (I); and (c) cleaving the oligonucleotide

CC multimer at the cleavage site to produce (I) having well defined ends.

CC The method is used for the large-scale synthesis of DNA and RNA oligomers

CC for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT New detectably labelled oligonucleotide multimer, comprising multiple
PT contiguous copies of a repeated oligonucleotide - useful for detecting
PT target molecules in diagnosis and medicinal applications.
XX
PS Example 2; Page 41; 103pp; English.
XX
CC The present invention describes a detectably labelled oligonucleotide
CC multimer, comprising multiple contiguous copies of a repeated
CC oligonucleotides. The detectably labelled oligonucleotide multimer is
CC useful for detecting a target molecule. Oligonucleotide multimers may be
CC produced in sufficient quantity to be useful for diagnostic and medical
CC applications. The multimers are useful for affinity labelling of
CC proteins, and for signal amplification in highly sensitive affinity
CC capture and sequence identification applications. The method provides a
CC faster, cheaper and simpler way for large-scale production of DNA and RNA
CC oligomers and multimers. The incorporation of labels enables the
CC oligonucleotide multimers to be useful in diagnostics and medicine. The

CC present sequence represents an oligonucleotide used in an example from
CC the present invention

PT Synthesizing RNA oligonucleotide involves combining single-stranded
PT circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT enzyme to yield desired RNA complementary to circular oligonucleotide
PT template.
XX
PS Example 2; SEQ ID NO 5; 78pp; English.
XX
CC The invention relates to a method for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template with at least two types of ribonucleotide
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC oligonucleotide multimer complementary to the circular oligonucleotide
CC template, where the RNA oligonucleotide multimer comprises multiple
CC copies of the desired RNA oligonucleotide. The method is useful for
CC synthesising an RNA oligonucleotide with well-defined ends. The circular
CC oligonucleotide is introduced into the cell using direct injection,
CC electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC cation-mediated delivery. The method is useful for treating bacterial
CC and/or viral infections in mammals, particularly drug resistant
CC infections, and for producing double stranded DNA oligomers. The method
CC is performed in the absence of an oligonucleotide primer, or without the
CC addition of auxiliary proteins. This sequence represents an
CC oligonucleotide used in the method of the invention.

CCthe gene and which hybridise to it at high stringency), from Aspergillus
CCniger. Also included are a nucleic acid construct comprising the above
CCpolynucleotide operably linked to one or more control sequences that
CCdirect the production of the polypeptide in a suitable expression host, a
CCrecombinant expression vector comprising the above nucleic acid
CCconstruct, a recombinant host cell comprising the above construct or
CCvector, and producing the protein comprising cultivating an above strain/
CCrecombinant host cell to produce a supernatant and/or cells comprising
CCthe polypeptide and recovering the polypeptide. The aminopeptidase is
CCused to prepare a food composition such as dough to enhance the flavour
CCof a baked product from the dough and for preparing a cheese to enhance
CCthe flavour. The invention provides a bacterial enzyme for protein
CChydrolysis i.e. with aminopeptidase activity, to produce flavouring
CCagents, and the enzyme has been isolated and characterised, compared to a
CCpreviously observed weak aminopeptidase activity which was detected in an
CCAspergillus niger culture filtrate but the source was never isolated or
CCidentified. The use of enzymes to produce flavouring agents from
CCproteinaceous material is better than use of strong acids which can
CCseverely degrade the amino acids obtained. The present sequence is a
CCreverse transcriptase (RT)-PCR primer used to investigate the intron-exon
XXstructure of the aminopeptidase gene

XXDetecting an analyte in a sample comprises providing nucleic acid
PTsequence which is catalytically active in presence of analyte, contacting
PTcatalytic nucleic acid with substrate and amplifying catalytic product.
XXDisclosure; Page; 36pp; English.
PSThe invention relates to a method of detecting an analyte in a sample.
CCThe method comprises providing a nucleic acid sequence which is initially
CCcatalytically inactive, but which becomes catalytically active in the
CCpresence of an analyte (the effector); providing a nucleic acid substrate
CCfor the catalytic activity of the nucleic acid sequence; and contacting
CCthe nucleic acid sequence and the substrate with the sample under
CCconditions allowing catalytic activity of nucleic acid sequences. The
CCcatalytic nucleic acid sequence will be able to convert the nucleic acid
CCsubstrate into a nucleic acid product only if the analyte of interest is
CCpresent. The nucleic acid catalytic product is then amplified, and a
CCsignificant increase in the amount of product indicates the presence of
CCthe analyte in the sample. The method is useful for the qualitative or
CCquantitative determination of an analyte in a sample in diagnostic
CCassays. The invention describes the in vitro selection of a ribozyme
CCligase (L1; AAA57859, AAA57860) which is catalytically active only in the
CCpresence of an oligonucleotide effector (AAA57854). The L1 ribozyme
CCligase was selected from a pool of RNA molecules comprising a central
CCrandomised region 90 nucleotides in length flanked on both sides by
CCconstant sequence regions (the N90 RNA pool; AAA57851). In the presence
CCof the effector, selection was performed using one of the tagged
CCsubstrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,
CCthose which have become ligated to the substrate molecule) were reverse
CCtranscribed using the effector oligo, and then PCR amplified using the
CCeffector and a DNA primer identical in sequence to the substrate used for

CC the selection. A ribozyme ligase, L1, was selected via this procedure. L1
CC can only adopt its active conformation (AAAS7859) in the presence of the
CC effector oligo (analyte). In the absence of the effector, L1 adopts an
CC inactive conformation (AAAS7860). The present sequence represents the
CC deoxy-A22-tagged substrate oligonucleotide. The dA22 tag enables
CC successfully ligated products to be isolated using oligo(dT)12-18
CC cellulose. Note: The present sequence is not given in the specification,
CC but is created from the informamtion given on page 11

XX
PT Regulating production of a product in a cell, comprises inserting a
PT regulatable catalytically active nucleic acid into a gene that produces
PT the product or regulates the production of the product in the cell.

XX
PS Example 6; Page 76; 128pp; English.

XX The present invention describes a method for regulating production of a
CC product in a cell. The method comprises inserting a regulatable
CC catalytically active nucleic acid (RCANA) into a gene that produces the
CC product or regulates the production of the product in the cell, where the
CC RCANA comprises a catalytic domain which modifies a transcript to alter
CC its coding potential and a regulatory domain that recognises an effector
CC that alters the function of the catalytic domain, and contacting the
CC regulatory domain with an effector to regulate production of the product.
CC Also described: (1) regulating a biological pathway in cell; and (2)
CC screening a population of cells for a cell that produces a bioproduct.
CC The methods are useful for regulating a biological pathway in cell, or
CC regulating production of a product in a cell. The RCANAs are useful as
CC regulatory elements to control the expression of genes in a metabolic
CC pathway, or as regulated selectable markers to increase a selective
CC pressure favouring or disfavouring production of a targeted bioproduct.
CC The RCANAs are also useful for in vitro or in vivo sensing or detection,
CC and in gene therapy. The present sequence represents an RNA substrate
CC oligonucleotide, which is used in an example from the present invention.

CC The present sequence is a human clusterin cDNA target for a double-
CC stranded short interfering RNA (siRNA) of the invention ADL70519-
CC ADL70520. It was used in an example from the invention to demonstrate
CC clusterin gene silencing in PC-3 prostate cancer cells. Clusterin, also
CC known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate
CC tumour cells following androgen withdrawal, and has also been shown to be
CC critical for neuritic toxicity in mouse models of Alzheimer's disease.
CC siRNAs of the invention can be used alone or in combination with other
CC chemotherapy or apoptosis inducing treatments for the treatment of
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,
CC anaplastic large cell lymphoma and melanoma, and also for the treatment
CC of Alzheimer's disease.

PT Creating an insertional mutation in the germ line of an animal, useful
PT for generating a mutation in an offspring of an animal, comprises
PT introducing into an animal a nucleic acid molecule comprising a germ line
PT specific promoter.
XX
PS Example 4; SEQ ID NO 151; 102pp; English.
XX
CC The invention describes a method of creating an insertional mutation in
CC the germ line of an animal by introducing into an animal a nucleic acid
CC molecule comprising a germ line specific promoter. The method is useful
CC for generating a mutation in an offspring of an animal, or for isolating
CC a nucleic acid from a genome of an offspring of an animal. The method may
CC also be used to correct genetic defects in animals, especially humans.
CC The nucleic acid is useful for generating mutations in a cell for
CC assessing the frequency with which selected cells under go insertional
CC mutagenesis for the generation of transgenic animals. This sequence
CC represents a primer used to characterise the insertion site of the
CC L1/enhanced green fluorescent protein (EGFP) retrotransposon cassette
CC into the mouse genome.

PT polymorphic sites in a 5' flanking region of a CYP2D6 gene, as
PT hybridization probes, as components of diagnostic assays, or in ligase-
PT based sequence determination.
XX
PS Claim 2; Page 23; 63pp; English.
XX
CC The invention relates to sequence determination oligonucleotides for
CC detecting polymorphic sites in a 5' flanking region of cytochrome P450
CC 2D6 (CYP2D6) gene. CYP2D6 enzymes are involved in the metabolism of many
CC different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The
CC oligonucleotides may be used as in situ hybridisation probes, in ligase-
CC based sequenced determination, as components of diagnostic assays, as
CC probes in sequence determination methods based on mismatches, as
CC hybridisation-based diagnostic assays, and as components of diagnostic
CC microarray. CYP2D6 is useful to predict variations in an individual's
CC ability to metabolise certain drugs. The present sequence is a sense
CC oligonucleotide used for detecting of human CYP2D6 gene 5' flanking
CC region single nucleotide polymorphism (SNP)

XX
PS Claim 10; Page 5; 38pp; English.
XX
CC Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC generic formula, in the 3'-5' or 5'-3' direction: (Gafa')a''-(Gbtb')b''-
CC (Gctc')c''-(Gdtd')d''-(Gete')e''-(Gftf')f''-(Ggtg')g''-N', where: N and
CC N' = T or G, equal or different from each other; x = 0-8, equal or
CC different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC 16, equal or different from each other; The oligonucleotides are believed
CC to selectively bind and sequester some proteins which are essential to
CC the viability and growth of tumoural cell line. They have specific and
CC selective cytotoxic activity against tumour cells, and can be used for
CC treating tumours of the liquid type, in particular of lymphoblastic
CC origin, and of solid type, in particular lymphomas. The present
CC phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC reduced growth of CCRF-CEM tumoural cells by 76%, which is detectable 48
CC hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PS Example 17; Page 82; 139pp; English.
XX
CC This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
CC invention.

PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX
PS Example 3; Page 28; 64pp; German.
XX
CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (NM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a

CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins, and
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
CC protein (PrP) comprising a polymorphic microsatellite locus.

PT Characterizing cellular activity of compound, by receiving images of
PT cells with known activity and images of cells treated with compound,
PT characterizing phenotypic attributes of images and comparing the
PT phenotypes.
XX
PS Disclosure; Fig 18; 139pp; English.
XX
CC This invention relates to a novel method for the characterisation of the
CC activity of a compound on cell. The method involves receiving images of
CC cells with a cellular activity and images of other cells treated with the
CC compound, quantitatively characterising phenotypic attributes of the
CC image of cells with a cellular activity to produce a target phenotype for
CC the cellular activity and that of the image of other cells to produce a
CC second phenotype for the compound, and comparing the two phenotypes to
CC determine whether the compound possesses cellular activity. The invention
CC may be useful for characterising cellular activity of a compound, for
CC determining information about properties of substances based upon the
CC information about structure of living or non-living cells exposed to
CC substances. The invention is also useful for identifying promising
CC candidates in a search for new and better medicines and treatments using
CC multiple biological descriptors from a single cell markers or components.

PT  Creating an insertional mutation in the germ line of an animal, useful
PT  for generating a mutation in an offspring of an animal, comprises
PT  introducing into an animal a nucleic acid molecule comprising a germ line
PT  specific promoter.
XX
PS  Example 2; SEQ ID NO 94; 102pp; English.
XX
CC  The invention describes a method of creating an insertional mutation in
CC  the germ line of an animal by introducing into an animal a nucleic acid
CC  molecule comprising a germ line specific promoter. The method is useful
CC  for generating a mutation in an offspring of an animal, or for isolating
CC  a nucleic acid from a genome of an offspring of an animal. The method may
CC  also be used to correct genetic defects in animals, especially humans.
CC  The nucleic acid is useful for generating mutations in a cell for
CC  assessing the frequency with which selected cells under go insertional
CC  mutagenesis for the generation of transgenic animals. This sequence
CC  represents an exemplary cleavage site of the endonuclease encoded by
CC  human L1 retrotransposon EN domain.

PT Amplifying RNA sequences, useful in detecting diseases or mutation,
PT comprises synthesizing first strand cDNA, circularizing first strand
PT cDNA, and replicating the circularized cDNA molecules by rolling circle
PT replication.
XX
XX Disclosure; SEQ ID NO 6; 64pp; English.
XX
CC The present invention relates to composition and method for amplifying
CC RNA sequences. The method involves synthesizing first strand cDNA
CC molecules from RNA molecules, circularising the first strand and
CC replicating the circularised first strand cDNA molecules using rolling
CC circle replication. The method is useful for producing nucleic acid
CC molecules corresponding to RNA molecules in an RNA sample, for
CC identifying or analysing and comparing RNA molecules and or sequences
CC expressed in different cells, tissues and or samples. The invention is
CC also useful in detecting disease (e.g. cystic fibrosis, muscular
CC dystrophy or diabetes), mutation detection, gene discovery, gene mapping
CC (molecular haplotyping), agricultural research, and assessment of
CC predisposition for cancers, e.g. prostate, breast, lung, colon or ovarian
CC cancer. The present sequence is a junction-specific cDNA primer. This
CC sequence is used to illustrate the method of invention.

XX Determining whether a product of a gene is involved in preventing a
PT replication error in a cell comprises providing a specific inhibitor for
PT the product and determining the level of expression of a marker gene.
XX Example 1; Fig 3; 47pp; English.

XX The specification describes a method for determining whether a product of
CC a gene is involved in preventing a replication error in a cell. The
CC method comprises providing the cell with a specific inhibitor for the
CC product and determining the level of functional expression of a marker
CC gene in the cell, where the level of expression of the marker gene is
CC dependent on the occurrence of the replication error. The method is used
CC for determining whether a product of a gene is involved in preventing a
CC replication error in a cell. The identified genes are useful for
CC developing diagnostic tools, or as targets for drug development to
CC manipulate cells on the basis of the presence or absence of function of
CC the gene. ABZ23535-36 represents fragments of plasmids used to detect
CC somatic instability, in the course of the invention

XX Typing genes that contain polymorphic microsatellite loci, useful for

PT identifying predisposition to disease, by amplification and determining

PT length of amplicons.

XX Example 3; Page 28; 64pp; German.

PS The invention describes a method of typing (M1) a gene (I) that has one

XX or more polymorphic microsatellite loci (PML). The method comprises: PCR

CC amplification of at least one DNA region of (I) that includes PML, using

CC as template a DNA sample containing at least one segment of (I); and

CC determining the length of the resulting amplicon(s). Also described are:

CC a method of determining (M2) microsatellite markers (MM) for

CC predisposition to a disease, associated with a gene that includes one or

CC more PML; and prediagnosis (M3) of diseases associated with gene that

CC include PML. The method is used to identify microsatellite markers, in a

CC disease-related gene, that are associated with a predisposition to

CC diseases and for prediagnosis of such diseases, especially prion diseases

CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and

CC metabolic diseases; also to type genes that encode milk proteins,

CC hormones or transcription factors. The method is simpler, quicker and

CC particularly less expensive than known methods based on sequencing. This

CC sequence represents a primer used to genotype a region of the cow prion

CC protein (Prp) comprising a polymorphic microsatellite locus.

PT Generating mutation in gene using cells which contain defective mismatch

PT repair gene, useful to generate genetically altered mutations with new

PT output traits.

XX

PS Example 5; Fig 7; 59pp; English.

XX

CC The patent discloses a method for generating hypermutable organisms.

CC Dominant negative alleles of human mismatch repair genes can be used to

CC generate hypermutable cells and organisms. They increase the rate of

CC spontaneous mutations by reducing the effectiveness of DNA repair and

CC thereby render the cells or animals hypermutable. The method is used to

CC produce genetically altered organisms to produce new output traits. The

CC present sequence is a bacterial poly purine nucleotide phosphorylase

CC (polyPNP) DNA fragment containing an out-of-frame polyA tract. This

CC sequence is used in the exemplification of the invention

XX Characterizing cellular activity of compound, by receiving images of
PT cells with known activity and images of cells treated with compound,
PT characterizing phenotypic attributes of images and comparing the
PT phenotypes.

XX Disclosure; Fig 18; 139pp; English.

XX This invention relates to a novel method for the characterisation of the

CC activity of a compound on cell. The method involves receiving images of

CC cells with a cellular activity and images of other cells treated with the

CC compound, quantitatively characterising phenotypic attributes of the

CC image of cells with a cellular activity to produce a target phenotype for

CC the cellular activity and that of the image of other cells to produce a

CC second phenotype for the compound, and comparing the two phenotypes to

CC determine whether the compound possesses cellular activity. The invention

CC may be useful for characterising cellular activity of a compound, for

CC determining information about properties of substances based upon the

CC information about structure of living or non-living cells exposed to

CC substances. The invention is also useful for identifying promising

CC candidates in a search for new and better medicines and treatments using

CC multiple biological descriptors from a single cell markers or components.

XX PT Mammaglobin, secreted protein overexpressed in breast cancer.
XX PS Example 2; Page 55; 60pp; English.
XX CC The present primer was used to reverse transcribe RNA encoding a human mammary-specific protein, designated mammaglobin. The specification describes a protein comprising a mammaglobin antigen that is recognized by B and/or Tc cells specific for the natural, secreted and glycosylated form of mammaglobin polypeptide. This protein, or recombinant vectors that express it, are used in vaccines for treating mammaglobin-expressing cancers, specifically of the breast. Such cancers can also be treated using autologous tumor lymphocytes activated ex vivo with an mammaglobin antigen, then returned to the patient. Expression of mammaglobin is elevated in 27% of stage I primary breast cancers, so it represents a marker useful for diagnosis of this disease

XX PT Oligonucleotides inhibiting protein kinase, useful for treating diseases such as cancer and autoimmune disease.
XX PS Example 8; Col 27-28; 26pp; English.
XX CC This invention describes novel purified aptameric oligonucleotides which have antimicrobial, cytostatic and immunosuppressive activity. The oligonucleotides are useful for binding to and preventing or inhibiting the biological function of a protein kinase or a target molecule and for detecting the presence or absence of a target molecule in biological samples. The oligonucleotides are also useful for prophylactic and therapeutic treatment of diseases such as cancer, autoimmune diseases and diseases caused by pathogenic microorganisms. This sequence represents a primer used in the method of the invention

XX PT Clusterin and gp38K-related peptide capable of altering cell migration useful for treating atherosclerosis, cancer and stenosis following vascular trauma or disease.
XX PS Disclosure; Page 12; 43pp; English.
XX CC The present sequence is a PCR primer for the porcine clusterin gene. Clusterin (also known as complement cytotoxicity inhibitor, sulfated glycoprotein-2, testosterone repressed prostate message-2, SP-40, 40 and ApoJ) is essential for the migration of vascular smooth muscle cells (VSMC). The gene and protein can, therefore, be used to promote wound healing, angiogenesis and vasculogenesis, in the treatment of stenosis following vascular trauma or disease and to treat atherosclerosis, and antisense sequences can be used to treat cancer, as angiogenesis is vital

PT Vaccinating against tumors, infectious diseases, allergies and asthma
PT using immunostimulatory Py-rich and TG nucleic acids.
XX
PS Claim 101; Page 56; 338pp; English.
XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT Inhibiting angiogenesis in a subject, involves administering at least one
PT antiangiogenic nucleic acid molecule to the subject.
XX
PS Claim 2; Page 35; 276pp; English.
XX
CC The invention relates to inhibiting angiogenesis in a subject, comprising
CC administering at least one antiangiogenic nucleic acid molecule. Also
CC included is a kit comprising a first container housing the antiangiogenic
CC nucleic acids, and instructions for administering them to a subject
CC having a condition characterised by unwanted angiogenesis. The method is
CC useful for inhibiting angiogenesis associated with solid tumour growth,
CC tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
CC rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
CC neovascularisation, telangiectasia, haemophilic joints, angiofibroma,
CC wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
CC hypertrophic scars. The present sequence is an antiangiogenic nucleic
CC acid of the invention

PT Treating or preventing cancer, such as basal cell carcinoma, comprises
PT administering immunostimulatory nucleic acids that induce expression of

PT cell surface antigens and antibodies to a subject having or at risk of
PT developing cancer.
XX
PS Disclosure; Page 309; 312pp; English.
XX
CC The present invention relates to methods for treating or preventing
CC cancer, involving administering to a subject having or at risk of
CC developing cancer immunostimulatory nucleic acids that induce expression
CC of cell surface antigens and antibodies. The methods are useful for
CC treating or preventing cancer such as basal cell carcinoma, bladder
CC cancer, bone cancer, brain and central nervous system (CNS) cancer,
CC breast cancer, cervical cancer, colon and rectum cancer, connective
CC tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx
CC cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-
CC Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian
CC cancer, pancreatic cancer, prostate cancer, rhabdomyosarcoma, skin
CC cancer, stomach cancer, testicular cancer, and uterine cancer. The
CC present sequence is an immunostimulatory oligonucleotide described in the
CC exemplification of the invention

PT Novel antisense compound targeted to nucleic acid molecule encoding
PT clusterin, useful for treating animal having disease associated with
PT clusterin such as hyperlipidemic disorder, cardiovascular disorder.
XX
PS Example 13; Page 80; 125pp; English.
XX
CC The invention comprises antisense oligonucleotides that are capable of
CC inhibiting expression of the human clusterin gene. The antisense
CC oligonucleotides of the invention are useful for inhibiting the
CC expression of clusterin in cells. The antisense oligonucleotides are also
CC useful for treating an animal with a disease or condition associated with
CC clusterin (e.g. hypercholesterolaemia; cardiovascular disorders;

CC hyperproliferative disorders; and hyperlipidemic disorders). The present
CC DNA sequence represents a PCR probe specific for the human clusterin
CC gene. NOTE: The present sequence is labelled with a fluorescent reporter
CC dye (FAM) and a quencher dye (TAMRA)

PT Assessing condition e.g. athletic ability, stage of disease, presence of
PT drugs, response to exercise, response to vaccines, therapies, nutritional
PT states, of performance animal involves analyzing nucleic acid expression.
XX
PS Disclosure; Page 46; 87pp; English.
XX
CC The invention relates to a method for assessing a condition of a
CC performance animal. The method involves determining in sample abundance
CC of expressed target nucleic acid; transmitting digital sample signal to
CC remote diagnostic server; processing digital sample signal at remotely
CC located database to correlate digital signal with digital information and
CC returning report of particular condition of animal. The method is useful
CC for assessing a condition of a performance animal preferably human, dog
CC or camel. The condition can be an athletic ability and a condition that
CC enhances, hinders, impedes or does not change an expected ability of the
CC performance animal; and also normal, pre-clinical, overt progress and/or
CC stage of disease, undiagnosed of unclassified conditions, presence of
CC drugs, response to exercise, response to vaccines, therapies, nutritional
CC states and response to environmental conditions. Diseases assessed by the
CC invention include laminitis, lameness, viral or bacterial disease,
CC gastritis, gastric ulcers, respiratory ailments, fractures, epistaxis,
CC musculoskeletal damage or disorders and joint diseases. The present
CC sequence is a primer used to illustrate the method of the invention

XX New modified antisense oligonucleotide, useful particularly for treating
PT prostatic cancer, inhibits the testosterone-repressed prostate message-2.
XX
XX Example 5; Page 40; 44pp; English.
XX
CC The invention relates to a compound consisting of an oligonucleotide with
CC a phosphorothioate backbone throughout, in which: (a) sugars on
CC nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the
CC remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at
CC positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence
CC ACF36398 (I) is used: (a) to delay progression of androgen-sensitive
CC prostatic cancer cells to the androgen-independent state, in vivo or in
CC vitro; (b) to treat prostatic cancer (after initially withdrawing
CC androgens to induce apoptosis); and (c) to increase sensitivity of cancer
CC cells (prostatic, renal, non-small cell lung, urothelial transitional,
CC ovarian and some breast cancer cells) that express abnormal levels of
CC TRPM-2 to chemotherapy or radiation. The modifications present in (I)
CC increase stability in vivo and activity (both in vivo or in vitro) and
CC result in a synergistic increase in effect when (I) is used with
CC chemotherapeutic agents or other antisense oligonucleotides directed
CC against other antiapoptotic genes. The present sequence represents an
CC anti-apoptotic protein TRPM-2 (testosterone-repressed prostate message-2)

PT New modified antisense oligonucleotide, useful particularly for treating
PT prostatic cancer, inhibits the testosterone-repressed prostate message-2.
XX
PS Example 5; Page 41; 44pp; English.
XX
CC The invention relates to a compound consisting of an oligonucleotide with
CC a phosphorothioate backbone throughout, in which: (a) sugars on
CC nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the
CC remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at
CC positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence
CC ACF36398 (I) is used: (a) to delay progression of androgen-sensitive
CC prostatic cancer cells to the androgen-independent state, in vivo or in
CC vitro; (b) to treat prostatic cancer (after initially withdrawing
CC androgens to induce apoptosis); and (c) to increase sensitivity of cancer
CC cells (prostatic, renal, non-small cell lung, urothelial transitional,
CC ovarian and some breast cancer cells) that express abnormal levels of
CC TRPM-2 to chemotherapy or radiation. The modifications present in (I)
CC increase stability in vivo and activity (both in vivo or in vitro) and
CC result in a synergistic increase in effect when (I) is used with
CC chemotherapeutic agents or other antisense oligonucleotides directed
CC against other antiapoptotic genes. Sequences ACF36399-406 represent
CC antisense oligonucleotides targeted against human anti-apoptotic protein
CC TRPM-2 (testosterone-repressed prostate message-2) gene

PT Identifying at least one epigenetically silenced gene associated with

PT cancer useful for treating cancer comprises contacting an array of genome
PT with nucleic acid molecule that reactivates expression of epigenetically
PT silenced gene.
XX
PS Example 1; SEQ ID NO 27; 97pp; English.
XX
CC This invention relates to novel methods of screening to identify
CC epigenetically silenced genes. Specifically, it refers to the detection
CC of epigenetically silenced tumour suppressor genes in cancer cells, which
CC are transcriptionally inactive due to aberrant methylation at normally
CC unmethylated CpG islands. Accordingly, these genes provide diagnostic
CC markers for immortalised and transformed cells and hence can be used to
CC diagnose various proliferative disorders, particularly oesophageal cancer
CC and head and neck cancer. The present invention describes a genomic
CC screening method to identify silenced genes in a cell suspected of a
CC predisposition to, or exhibiting, unregulated growth. Accordingly,
CC oligonucleotides of the genes identified herein are useful for detecting
CC oesophageal squamous cell carcinoma (ESCC) or neck squamous cell
CC carcinoma. Furthermore, treatment can occur via gene therapy, using a
CC demethylation agent such as a methyltransferase inhibitor (5Aza-dC) or a
CC histone deacetylase inhibitor to restore expression of at least one
CC methylation silenced gene in cancer cells. This oligonucleotide sequence
CC is an RT-PCR primer used to amplify those genes that were up-regulated as
CC a result of treatment with a demethylation agent i.e epigenetically
CC silenced genes of the invention.

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 5; 8pp; German.
XX
CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides

CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC acids (amino, carboxylic or fatty acid) or their derivatives, organic
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

CC The present invention provides a method for treating cancer in which

CC cancer cells express testosterone-repressed prostate message-2 (TRPM-2).

CC The invention is useful for enhancing the chemo-sensitivity or radiation-

CC sensitivity of cancer cells for treating cancer such as prostate cancer,

CC bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma

CC (RCC). The invention is also useful in antisense gene therapy. The

CC present sequence is human testosterone-repressed prostate message-2 (TRPM

CC -2) antisense oligodeoxyribonucleotide (ODN).

PT Enriching low abundance polynucleotides in a sample, useful for gene

PT expression analysis, comprises exposing the sample to an enzymatically

PT non-extendable nucleobase oligomer to block polymerase activity on high

PT abundance species.

XX

PS Example 1; Page 20; 43pp; English.

XX

CC The invention relates to a method of enriching a low abundance

CC polynucleotide in a sample of polynucleotides comprising a low abundance

CC and a high abundance polynucleotide. The method comprises exposing the

CC sample to an enzymatically non-extendable nucleobase oligomer having a

CC nucleobase sequence complementary to a sequence within the high abundance

CC polynucleotide under conditions so that base pairing occurs, and

CC subjecting the sample to conditions for polymerase extension. Preferably,

CC the enzymatically non-extendable nucleobase oligomer does not have a

CC ribose-containing oligomeric structure. It is a peptide nucleic acid

CC (PNA) oligomer or is a modified nucleotide oligomer or internucleotide

CC analogue oligomer. The modified nucleotide oligomer is selected from 2'-

CC modified and 3'-modified nucleotide oligomers. The 2'-modified and 3'-

CC modified nucleotide oligomers are selected from 2'-O-alkyl modified

CC nucleotide oligomers and 3'-alkyl modified nucleotide oligomers. The 2'-O

CC -alkyl modified nucleotide oligomers are 2'-O-methyl nucleotide

CC oligomers. The modified nucleotide oligomer or internucleotide analogue

CC oligomer is selected from locked nucleic acids (LNA), N3'-P5'
CC phosphoramidate (NP) oligomers, minor groove binder-linked-
CC oligonucleotides (MGB-linked oligonucleotides), phosphorothioate (PS)
CC oligomers, C1-C4 alkylphosphonate oligomers, phosphoramidates, beta-
CC phosphodiester oligonucleotides, and alpha-phosphodiester
CC oligonucleotides. The C1-C4 alkylphosphonate oligomers are methyl
CC phosphonate (MP) oligomers. The enzymatically non-extendable nucleobase
CC oligomer is chimeric. The sample comprises more than one high abundance
CC polynucleotide. The sample comprises RNA, and polymerase extension is by
CC reverse transcription to yield a first strand cDNA. The method further
CC comprises second strand cDNA synthesis. The sample is exposed to the
CC nucleobase oligomer during the first and/or second strand cDNA synthesis.
CC The method further comprises an amplification step, which is by
CC polymerase chain reaction (PCR) or by in vitro transcription. The RNA is
CC mRNA or cRNA or total cellular RNA. Alternatively, the sample comprises
CC DNA, and polymerase extension is by DNA-dependent DNA polymerase in a
CC PCR. The method also comprises labelling the amplified polynucleotides.
CC The labelling is concomitant with or subsequent to amplification. The
CC methods are useful in selective enrichment of low abundance
CC polynucleotides in a sample. The pool of enriched polynucleotides may be
CC used in analysing gene expression and in creating cDNA libraries. The
CC present sequence represents a reverse transcriptase (RT)-PCR primer which
CC was used to amplify the human import precursor of subunit B of the H+
CC transporting, mitochondrial ATP synthase, subunit B, isoform 1 (ATP5F1)
CC gene.

XX
CC The present sequence is the sense strand of a short interfering RNA
CC (siRNA) targeted to nucleotides 487-505 of human clusterin cDNA. The
CC antisense strand is also provided ADL70457. The siRNA can be used to
CC interfere with the expression of clusterin. Clusterin, also known as
CC testosterone-repressed prostate message-2 (TRPM-2) or sulfated
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate
CC tumour cells following androgen withdrawal, and has also been shown to be

CC critical for neuritic toxicity in mouse models of Alzheimer's disease.
CC siRNAs of the invention can be used alone or in combination with other
CC chemotherapy or apoptosis inducing treatments for the treatment of
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,
CC anaplastic large cell lymphoma and melanoma, and also for the treatment
CC of Alzheimer's disease. In an example from the invention, the present
CC siRNA was used to examine the effects of clusterin gene silencing in PC-3
CC prostate cancer cells. A reduction in clusterin transcript was observed.

PT disease or cancer.

```

XX Claim 4; SEQ ID NO 4; 63pp; English.
XX
XX The present sequence is the antisense strand of a short interfering RNA
CC (siRNA) targeted to nucleotides 1105-1123 of human clusterin cDNA. The
CC sense strand is also provided ADL70458. The siRNA can be used to
CC interfere with the expression of clusterin. Clusterin, also known as
CC testosterone-repressed prostate message-2 (TRPM-2) or sulfated
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate
CC tumour cells following androgen withdrawal, and has also been shown to be
CC critical for neuritic toxicity in mouse models of Alzheimer's disease.
CC siRNAs of the invention can be used alone or in combination with other
CC chemotherapy or apoptosis inducing treatments for the treatment of
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,
CC anaplastic large cell lymphoma and melanoma, and also for the treatment
CC of Alzheimer's disease.

PT disease or cancer.

```

```

XX Claim 4; SEQ ID NO 59; 63pp; English.
PS
XX The present sequence is the antisense strand of a short interfering RNA
CC (siRNA) targeted to a specific portion ADL70512 of human clusterin cDNA.
CC The sense strand is also provided ADL70513. The siRNA can be used to
CC interfere with the expression of clusterin. Clusterin, also known as
CC testosterone-repressed prostate message-2 (TRPM-2) or sulfated
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate
CC tumour cells following androgen withdrawal, and has also been shown to be
CC critical for neuritic toxicity in mouse models of Alzheimer's disease.
CC siRNAs of the invention can be used alone or in combination with other
CC chemotherapy or apoptosis inducing treatments for the treatment of
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,
CC anaplastic large cell lymphoma and melanoma, and also for the treatment
CC of Alzheimer's disease. In an example from the invention, the present
CC siRNA was used to examine the effects of clusterin gene silencing in PC-3
CC prostate cancer cells. A reduction in clusterin transcript was observed.

XX
PT Treating melanoma in a mammalian subject comprises administering to the
PT subject a therapeutic agent effective to reduce the effective amount of
XX clusterin in the melanoma cells.
PS Claim 6; SEQ ID NO 8; 32pp; English.
XX
CC The present sequence is that of an antisense oligonucleotide targeted to
CC human clusterin ADL70403. The invention relates to the treatment of
CC melanoma through reduction in the effective amount of clusterin. The
CC therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421
CC or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
CC The antisense oligonucleotides are complementary to a region of the
CC clusterin mRNA spanning either the translation initiation site or the
CC termination site. They may be modified to increase stability in vivo,
CC e.g. they may be employed as phosphorothioate derivatives and may have 2'
CC -O-(2-methoxyethyl) modifications in the 5' and 3' 'wings'. A method for
CC regulating expression of bcl-xL in a subject or cell line comprises
CC administering an agent effective to modulate the amount of clusterin
CC expression. In clusterin-expressing cells, expression of bcl-xL is down-
CC regulated when the effective amount of clusterin is reduced. Such
CC inhibition is significant because bcl-xL is known to act as an inhibitor
CC of apoptosis.

XX
PT Treating melanoma in a mammalian subject comprises administering to the
PT subject a therapeutic agent effective to reduce the effective amount of
PT clusterin in the melanoma cells.
XX
PS Claim 7; SEQ ID NO 4; 32pp; English.
XX
CC The present sequence is that of an antisense oligonucleotide targeted to
CC human clusterin ADL70403. The invention relates to the treatment of
CC melanoma through reduction in the effective amount of clusterin. The
CC therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421
CC or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
CC The antisense oligonucleotides are complementary to a region of the
CC clusterin mRNA spanning either the translation initiation site or the
CC termination site. They may be modified to increase stability in vivo,
CC e.g. they may be employed as phosphorothioate derivatives and may have 2'
CC -O-(2-methoxyethyl) (MOE) modifications in the 5' and 3' 'wings'. The
CC present antisense oligonucleotide is particularly preferred. It is
CC targeted to the translation initiation codon and next 6 codons of the
CC human clusterin sequence. It has a phosphorothioate backbone throughout
CC and MOE wings, the remaining nucleotides being 2'-deoxynucleotides. In an
CC example from the invention, this antisense oligonucleotide provided a
CC dose-dependent down-regulation of clusterin in human melanoma cells,
CC leading to an increase in apoptotic cell death. In one melanoma cell line
CC (607B) this alone was sufficient to lead to complete cell death. In
CC another melanoma cell line, the surviving cells showed increased
CC sensitivity to subsequent treatment with cisplatin. A claimed method for
CC regulating expression of bcl-xL in a subject or cell line comprises
CC administering an agent effective to modulate the amount of clusterin
CC expression. In clusterin-expressing cells, expression of bcl-xL is down-
CC regulated when the effective amount of clusterin is reduced. Such
CC inhibition is significant because bcl-xL is known to act as an inhibitor
CC of apoptosis.

PT Treating melanoma in a mammalian subject comprises administering to the
PT subject a therapeutic agent effective to reduce the effective amount of
PT clusterin in the melanoma cells.
XX
PS Claim 6; SEQ ID NO 7; 32pp; English.
XX
CC The present sequence is that of an antisense oligonucleotide targeted to
CC human clusterin ADL70403. The invention relates to the treatment of
CC melanoma through reduction in the effective amount of clusterin. The
CC therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421
CC or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
CC The antisense oligonucleotides are complementary to a region of the
CC clusterin mRNA spanning either the translation initiation site or the
CC termination site. They may be modified to increase stability in vivo,
CC e.g. they may be employed as phosphorothioate derivatives and may have 2'
CC -O-(2-methoxyethyl) modifications in the 5' and 3' 'wings'. A method for
CC regulating expression of bcl-xL in a subject or cell line comprises
CC administering an agent effective to modulate the amount of clusterin
CC expression. In clusterin-expressing cells, expression of bcl-xL is down-
CC regulated when the effective amount of clusterin is reduced. Such
CC inhibition is significant because bcl-xL is known to act as an inhibitor
CC of apoptosis.

PT Synthesizing double-stranded cDNA, by synthesizing a cDNA strand from RNA
PT template, removing the template and synthesizing double-stranded cDNAs
PT using the cDNA as template in the presence of processive DNA polymerase
PT and random primers.
XX
PS Example 1; SEQ ID NO 2; 19pp; English.
PS
XX
CC The present invention relates to a method for synthesising double-
CC stranded cDNA, by synthesising first cDNA strands in a first reaction
CC mixture comprising reverse transcriptase, RNA template, and first strand
CC primer complementary to template, removing the template, synthesising
CC double-stranded cDNAs in a second reaction mixture comprising processive
CC DNA polymerase, DNA ligase, first cDNA strand as template and random
CC primers having a mixture of oligonucleotides having random DNA sequences.
CC Also disclosed is a method for amplifying a population of RNA molecules
CC to produce a pool of double-stranded cDNA molecules, and a kit for
CC synthesising double-stranded cDNA. The generated cDNA products are useful
CC in determining quantitative information about the genetic profile of
CC nucleic acid in original RNA sample. The method of the invention is
CC useful in differential gene expression assays for the analysis of
CC diseased and normal tissue and for large-scale correlation studies on
CC sequences, mutations, variants or polymorphisms among samples. The method
CC is efficient in synthesising improved cDNA molecules and effective in
CC generating useful quantities of an amplified cRNA product that comprises
CC a population of cRNA molecules in substantially the same relative molar

```
CC ratio as the RNA or mRNA starting material. The present sequence
CC represents a primer used for cDNA first strand synthesis.

```
CC The synthetic oligomer is capable of forming a triplex at physiological
CC pH with a purine rich target sequence by coupling into the major groove
CC of the duplex. The specific target sequence of this oligomer is the human
CC interleukin 6 gene untranslated sequence contg. a purine rich sequence
CC concd. on one strand of the duplex. The oligomer, and others like it are
CC useful in diagnosis and therapy of diseases characterised by specific DNA
CC duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant
CC tumours and inflammation. The triple helices form under mild conditions
CC thus assays may be carried out without subjecting the test specimen to
CC harsh conditions. The oligomer contains an inverted polarity region
CC formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso
CC (nucleotides have the 3'positions of xylose sugars linked via the o-
CC xylene ring). Two nucleotides are coupled through a xylene residue to
CC form the dimer synthon. This additional modifications may render the
CC oligomer stable to nuclease activity. The oligomer is able to inhibit
CC gene expression, as verified by in vitro systems. See also AAQ25452-25501
CC and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT Novel method of stabilizing duplex formation, or destabilizing non-
PT specific duplex formation using primer containing modified nucleotide
PT analogs, useful for preventing mispriming during PCR, RACE, DNA synthesis
PT or sequencing.
XX
```

PS Example 1; Page 25; 46pp; English.

XX The present invention describes a method for destabilising non-specific

CC duplex formation, between an oligonucleotide and a target nucleic acid

CC (NA), comprising incubating the target NA with a modified oligonucleotide

CC (I) comprising a homopolymeric sequence having a modification which

CC decreases or abrogates H-bonding between the modified oligonucleotide and

CC the non-specific target NA. The modified oligonucleotide is used to

CC improve discrimination between the targeted homopolymeric sequence and a

CC non-homopolymeric target sequence. It is used to increase the proportion

CC of full length cDNA clones for a library, to reduce mispriming during

CC sequencing, 5' or 3' RACE (rapid amplification of cDNA ends) or DNA

CC synthesis or to generate bona fide genetic markers. The present sequence

CC represents an oligonucleotide which is used in the exemplification of the

XX present invention

PS Example 1; Fig 3; 47pp; English.

XX

CC The specification describes a method for determining whether a product of

CC a gene is involved in preventing a replication error in a cell. The

CC method comprises providing the cell with a specific inhibitor for the

CC product and determining the level of functional expression of a marker

CC gene in the cell, where the level of expression of the marker gene is

CC dependent on the occurrence of the replication error. The method is used

CC for determining whether a product of a gene is involved in preventing a

CC replication error in a cell. The identified genes are useful for

CC developing diagnostic tools, or as targets for drug development to

CC manipulate cells on the basis of the presence or absence of function of

CC the gene. ABZ23535-36 represents fragments of plasmids used to detect

XX somatic instability, in the course of the invention

CC The present invention relates to a method for determining if a gene

CC product or compound is involved in preventing replication error in a

CC cell. The method involves providing a cell with a specific inhibitor for

CC a gene product or with a compound and determining the expression level of

CC a marker gene in the cell, where the expression level of the marker gene
CC is dependent on the occurrence of a replication error. The invention is
CC useful in gene therapy and for treating a subject having tumours or
CC cancer. The present sequence is a Caenorhabditis elegans heat-shock
CC promoter DNA. This sequence is used to illustrate the method of
CC invention.

XX New radiation hybrid map of the dog, Canine familiaris, genome, useful

PS Claim 1; Page 61; 87pp; English.

XX The present invention describes a radiation hybrid map of the dog (Canine

CC familiaris) genome comprising the genome location of a marker selected

CC from AAA66139 to AAA66942. The radiation hybrid map is useful for

CC identifying and localising dog genes, since it covers approximately 80 %

CC of the dog genome and provides a dense map integrating different types

CC (i.e. Type I and Type II) of markers. The map and the dog genome markers

CC (or complementary sequences) are especially useful to identify genes

CC responsible for phenotypic and behavioural traits in dogs, to identify

CC morbid genes, to analyse diseases and identify implicated genes in such

CC diseases and their alleles, and to study dog pedigrees. They may also be

CC useful for isolating corresponding human gene sequences e.g. genes

CC involved in genetic diseases

XX PT Human phosphatase 79 and encoded polynucleotide, applicable in diagnosis
PT and treatment of malignant tumor, hemopathy, HIV infection, immunological
PT diseases and various inflammation.
XX PS Example 3; Page 12; 38pp; Chinese.
XX CC The invention relates to human phosphatase 79 (AAH24264), nucleic acids
CC encoding it (AAH24264), and a method for the recombinant production of
CC human phosphatase 79. The present invention additionally discloses an
CC agonist of phosphatase 79 for therapeutic use, and an antibody which
CC specifically binds to human phosphatase 79. Human phosphatase 79, and
CC nucleotides which encode it may be used for treating a variety of
CC diseases, such as malignant tumours, blood diseases, HIV (human
CC immunodeficiency virus) infection, immune disorders and inflammatory
CC conditions. The protein may also be used to screen for modulators of its
CC activity or for peptide fingerprinting identification. The polynucleotide
CC can be used as a primer for nucleic acid amplification reaction or as a
CC probe for hybridisation reactions, or in producing gene chips or
CC microarrays. Sequences AAH24265-AAH24266 represent reverse transcription-
CC PCR (RT-PCR) primers used in an exemplification of the invention to
CC isolate human phosphatase 79 cDNA

PS Disclosure; Page 11; 45pp; English.
XX
CC The invention relates to systems for identification and characterisation
CC of gene expression in one or more samples, comprising an identifier having
CC a specific oligo-dt primer sequence, where the identifier comprises a
CC detectable marker at its 5' end. The system is useful for identifying any
CC or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC as the relative differences in mRNA between 2 or more samples, where
CC desired, for supporting discovery of new genes, and for identifying mRNAs
CC that are expressed at different levels between 2 or more samples. The new
CC system or method addresses limitations of prior methods by comprising
CC or biochemical assay compositions and systems are linked to DNA or RNA
CC sequence databases for optimal resource efficiency in assaying gene
CC expression. The system has the following advantages over existing
CC methods: (a) prior sequence information or clone library construction is
CC not needed to enable the assay; (b) provides immediate sequence
CC information in addition to information concerning changes or differences
CC in mRNA level, to determine mRNA expression level and mRNA identification
CC in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC sample for subsequent investigation by common molecular biology
CC techniques; and (d) does not require prior knowledge of the sequence of
CC the genome of the organism under investigation and can be employed in
CC organisms lacking significant genomic sequence in formation. The present
CC sequence represents an oligo dt primer used in the method of the
CC invention

PT acid sequence motif, useful for inducing B-cell activation, treating,
PT preventing or ameliorating immune system disorder or tumoral disease e.g.
XX melanoma.

PS Claim 14; SEQ ID NO 21; 139pp; English.

XX
CC This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG
CC variant DNA oligo, used in an exemplification of the invention.

XX New microarray, comprising a matrix of cDNA probe from a set of probes

PT immobilized to a solid surface in predetermined order, useful in the

PT prognosis of patients with clear cell renal carcinoma.

XX Example 2; Page 30; 179pp; English.

PS The present invention relates to a microarray comprising a matrix of at

XX least one cDNA probe from a set of probes immobilised to a solid surface

CC in a predetermined order, where a row of pixels corresponds to replicates

CC of one distinct probe from the set. The probes are complementary to

CC nucleic acid sequences that are expressed differentially in aggressive as

CC compared to non-aggressive types of clear cell renal carcinoma (CC-RCC)

CC and that hybridise to the probes under high stringency conditions. The

CC microarray is useful for the prognosis of patients with CC-RCC, wherein

CC aggressive and non-aggressive CC-RCC tumour types are characterised by

CC differential expression profiles of genes that hybridise with one or more

CC probes immobilised on the microarray. The arrays are useful for gene

CC expression profiling of tumour and normal tissues. The present sequence

CC represents an oligo-dT primer used in the examples of the present

CC invention

DR Selecting genes expressed in cancer cell, by characterizing cancer based

XX on functioning of gene selection by comparing expression of selected gene

PT from cancer cell with expression of selected genes from noncancerous

PT cell.

XX PS Example 2; Page 18; 53pp; English.

XX

CC The invention relates to a method of selecting genes expressed in a

CC cancer cell, which involves characterising cancer based on the

CC functioning of gene selection by comparing the expression of the selected

CC gene from the cancer cell with the expression of an identical selection

CC of genes from a noncancerous cell or different type of cancer cell. The

CC method is useful for selecting genes expressed in a cancer cell. The

CC method is useful for targeting the therapy of cancer by using a selection

CC of genes or their products expressed in a cancer cell, the gene selection

CC or a selection of product functioning to characterising cancer by

CC comparing the expression of the selected gene or their products from the

CC cancer cell with the expression of an identical selection of genes or

CC their products noncancerous. The method is also useful for diagnosing,

CC prognosing, monitoring and classifying a disease condition e.g. cancer

CC such as neuroblastoma, rhabdomyosarcoma, Burkitt's or Ewing family of

CC tumours. The present sequence represents an anchored oligonucleotide

CC primer used to extract RNA from cells.

XX Producing molecular array by immobilizing to solid phase several known

PT molecules at low density for allowing individual immobilized molecules to

PT be individually resolved and spatially addressable.

XX Disclosure; Page 152; 219pp; English.

XX The invention relates to a method of producing (M1) a molecular array,

CC involves: immobilizing to a solid phase a several molecules at a density

CC which allows individual immobilized molecules to be individually

CC resolved, where each molecule in the array is spatially addressable and

CC the identity of each molecule is known or determined prior to

CC immobilization; and optionally providing a molecular array comprising a

CC several molecules immobilized to a solid phase at a density such that

CC individual immobilized molecules are not capable of being individual

CC resolved, and reducing the density of functional immobilized molecules in

CC the array such that remaining individual functional immobilized molecules

CC are capable of being individually resolved, where each individual
CC functional molecule in the resulting array is spatially addressable and
CC the identity of each molecule is known or determined prior to the density
CC reduction step. The array efficiently resolve complex samples, separate
CC correct signals from erroneous signals, eliminates need for sample
CC amplification, detects transient interactions or temporal characteristic
CC of single molecule processes. This sequence represents anoligonucleotide
CC used in the method of the invention.

XX
XX Novel mutant of PON enzyme exhibiting increased substrate specificity to
PT PON substrate, useful for treating or preventing PON1-related diseases
PT e.g., hyperlipidemia, atherosclerosis, neurological disease or cancer.
XX
XX Example 1; SEQ ID NO 11; 240pp; English.
PS
XX

CC This invention relates to novel mutant serum paraoxonase (PON1) nucleic
CC acid molecules and the encoded proteins thereof. Specifically, it refers
CC to enzymes that are calcium dependent phosphotriesterases essential to
CC the detoxification process of organophosphates such as the insecticide
CC praaxon and the nerve agents sarin and soman. The present invention
CC describes a method to identify mutated PONs that exhibit substantially
CC identical (or improved) substrate specificity in comparison with the wild
CC -type PON and also those mutants that do not form aggregates when
CC expressed in bacteria. In particular, the method employed an in vitro
CC evolution process to identify proteins with desired traits such as
CC structural plasticity, catalytic activity and maintaining substrate

CC binding. These mutants have been found to be useful for treating or
CC preventing PON1-related diseases including hyperlipidaemia.
CC atherosclerosis, neurological disease (e.g. Alzheimer's disease,
CC neurofibromatosis, Huntington's disease, depression, amyotrophic lateral
CC sclerosis, multiple sclerosis, stroke, Parkinson's disease or multi-
CC infarct dementia), cancer and organophosphate poisoning. Accordingly,
CC they exhibit antilipaemic, antiarteriosclerotic, neuroprotective,
CC nootropic, cytosstatic, anticonvulsant, antidepressant and
CC antiparkinsonian activities, as well as being an antidote in a case of
CC poisoning. This oligonucleotide sequence is a PCR primer used for the
CC cloning and expression of a wild type PON1 gene of the invention.

PT Providing mRNA profile, by generating two independent patterns
PT characteristic of sample mRNA population, analyzing patterns, comparing
PT gene expression by cell types under varied conditions, and identifying
PT genes.
XX
XX Example 2; Page 45; 67pp; English.
PS
XX
XX The present invention relates to a method for providing a profile of mRNA
CC molecules present in a sample. The method comprises generating two
CC independent patterns characteristic of the population of mRNA molecules
CC expressed in the sample and analysing the patterns using a combinatorial
CC algorithm, comparing gene expression by different or same cell types
CC under different conditions, and identifying genes having a role in
CC various cellular processes. The method is useful for the analysis and
CC identification of transcribed genes, and fingerprinting. The method can
CC be used to identify genes which play a role in determining various
CC cellular processes, including susceptibility to external factors,
CC development, and disease. The present sequence for a PCR primer is used
CC in the methods of the present invention

XX PT Identifying and characterizing gene expression in samples, for
PT identifying mRNAs expressed at different levels, comprises employing an
PT identifier having a oligo-dT primer of a specific sequence and a
PT detectable marker at its 5' end.
XX Example 1; Page 15; 45pp; English.

XX CC The invention relates to systems for identification and characterisation
CC of gene expression in one or more samples, comprising an identifier having
CC a specific oligo-dT primer sequence, where the identifier comprises a
CC detectable marker at its 5' end. The system is useful for identifying any
CC or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC as the relative differences in mRNA between 2 or more samples, where
CC desired, for supporting discovery of new genes, and for identifying mRNAs
CC that are expressed at different levels between 2 or more samples. The new
CC system or method addresses limitations of prior methods by comprising
CC compositions and systems that incorporate new strategies where molecular
CC or biochemical assay compositions and systems are linked to DNA or RNA
CC sequence databases for optimal resource efficiency in assaying gene
CC expression. The system has the following advantages over existing
CC methods: (a) prior sequence information or clone library construction is
CC not needed to enable the assay; (b) provides immediate sequence
CC information in addition to information concerning changes or differences
CC in mRNA level, to determine mRNA expression level and mRNA identification
CC in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC sample for subsequent investigation by common molecular biology
CC techniques; and (d) does not require prior knowledge of the sequence of
CC the genome of the organism under investigation and can be employed in
CC organisms lacking significant genomic sequence in formation. The present
CC sequence represents an oligo dT primer used in the method of the
XX invention

XX PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX Example 3; Page 28; 64pp; German.

XX CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
CC protein (PrP) comprising a polymorphic microsatellite locus.

PS
XX The sequence is that of a bovine microsatellite sequence obt'd. by
CC screening a library of bovine MboI DNA fragments of between 250 and 500
CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC clones cross-hybridised. Assuming independent distribution of
CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC in the bovine genome is estimated at >100, 000. The sequence information
CC for ca. 230 such bovine microsatellites is summarised in the
CC specification and indexed herein (see below). The sequences upstream and
CC downstream of the microsatellite sequence were used to generate the
CC required PCR primers for in vitro amplification of the corresp.
CC microsatellite (using the program OPTIPRIM). The microsatellites may be
CC used to identify individuals, for parentage testing, and in the genetic
CC mapping of economic trait loci, or genes involved the determinism of
CC economically important traits esp. in cattle, to allow selective
CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT Assay device for haptent or its specific antibodies - comprises support
PT having competitive reagent immobilised via nucleic acid ligand to improve
PT orientation and accessibility.

XX Example 1; Page 10; 39pp; French.

CC Oligonucleotides (AAQ94201-Q94205) were synthesised for use as ligands.

CC The ligands are covalently linked to a hapten (esp. a steroid hormone) to

CC form a conjugate which is then immobilised on a solid support for

CC interaction with antibodies against the hapten. Nucleic acid ligands are

CC less likely to be recognised by the antibodies than are peptide ligands

CC and nucleic acids are also less likely to undergo intramolecular

CC organisation which interferes with accessibility of the hapten to the

CC antibodies. For immunodiagnosis of oestradiol, the active hapten

CC oestradiol-6-carboxymethoxime-N-hydroxysuccinimide ester was used.

XX Oligonucleotides having a partial sequence consisting of at least 15
CC bases of AAT63641 (an antisense oligo complementary to a region of the
CC tax gene which can inhibit human T-cell lymphotropic virus type 1 (HTLV-
CC 1) viral antigen expression) are claimed. In an example, six antisense
CC oligos were designed, T1-T6 (AAT63650-55) and were compared to six oligos
CC derived from other regions of HTLV-1, i.e. SJ1 (splice junction), P1
CC (p21), R1 (rex), RRI (rex response element), E1 (env) and G1 (gag), four
CC reference oligonucleotides TIS (tax-sense), HC (dc20), HT (dt20)
CC (AAT63647-49) and a random 20mer (RAN) in a HTLV-1 virus antigen
CC expression inhibiting test. Oligonucleotide T1 gave the best results

XX Mycobacterium vaccae polypeptides - used to develop products for use in
PT detection, therapy and prevention of mycobacteria infections or as immune
PT response enhancers.
PT
XX
PS Example 8; Page 99; 153pp; English.
XX
XX This oligonucleotide is used in the DNA cloning strategies of the
CC Mycobacterium vaccae antigens. The invention provides M. vaccae
CC polypeptides that comprise an immunogenic portion of a soluble M. vaccae
CC antigen, or a variant, where the antigen induces an immune response in
CC patients previously exposed to a mycobacterium. Such M. vaccae
CC polypeptides can be used in methods for enhancing non-specific immune
CC response. The methods and products can be used for the detection,
CC treatment and prevention of infectious diseases caused by mycobacteria
CC such as M. vaccae, M. avium or M. tuberculosis. The products also have
CC the ability to induce cell proliferation and cytokine production (e.g.
CC interferon-gamma and interleukin-12 production) in T cells, NK cells, B
CC cells, or macrophages. They can be used for enhancing immune responses
CC for use in vaccines or immunotherapy of infectious diseases and cancers

PT Separation of electrically charged target molecules - by capillary
PT affinity gel electrophoresis using polymer-gel to which receptors for
PT target molecules are bound.
XX
PS Example D3; Page 25; 41pp; English.

XX A mixture of oligonucleotides (AAT86604-7) were separated by a new
CC process using capillary affinity gel electrophoresis. The invention
CC relates to selective separation of electrically charged target molecules
CC in an analytical mixture. It comprises capillary affinity gel
CC electrophoresis using a capillary tube which is at least partly filled
CC with a polymer gel. Receptors for target molecules are covalently bound
CC to the polymer. An electric field of at least 50 volts/cm is applied. The
CC capillary tube is charged with the analytical mixture. In a first
CC separation stage, the target molecules in the mixture are bound to the
CC receptors and the remaining components are eluted, optionally whilst
CC splitting open. In a second stage, the elution conditions are changed,
CC the receptor is eliminated and the affinity of the target molecules for
CC detected, optionally whilst splitting open. The process is useful for
CC selective separation and/or determination of charged organic compounds,
CC such as oligonucleotides, peptides or carbohydrates. It may be used, e.g.
CC for isolation of specific proteins and DNA molecules, purification of
CC antibodies, analysis of antisense compounds or screening for enzyme
CC inhibitors. The process achieves higher resolution and selectivity than
CC prior art processes, especially in the case of complex biological
CC analytical mixtures. It has high sensitivity, even with small amounts of
CC samples. The derivatised polymers may be synthesised specifically using
CC standard methods

PT 2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have
PT high purity, use in machine synthesis of ribonucleic acids, enable longer
PT oligonucleotide chain construction, and larger amounts.

XX Example 6; Page 25; 38pp; English.

CC The invention relates to silyloxymethyl protected D- or L-ribonucleosides
CC and their phosphonates (I), and silyloxymethyl halides (II). (I) are
CC intermediates for synthesis of RNA-oligonucleotides with predetermined
CC nucleotide sequence, particularly by machine synthesis. The groups
CC specified above, apart from those on silyl, are those particularly for
CC the cyanoethyl phosphoramidate coupling. Uses of the oligoribonucleotide
CC products in diagnosis, therapy, and as research tools, are well known,
CC and are not dealt with in detail. (II) is an intermediate for (I). The
CC silyloxymethyl halide reagent is easy to prepare, and yields are high.
CC Introduction of the silyloxymethyl group into the ribonucleoside is
CC simple and rapid, and the acetal bond formed does not migrate,
CC eliminating particularly the prior art problem of 2' to 3' isomerisation.
CC The methylenedioxy group spacer between the silyl group and nucleoside
CC ring results in less steric hindrance than bulky direct silyloxy
CC linkages, enabling first, a range of choices for the silyl substituents,
CC to provide, e.g., acid or base stability; and second, higher yields in
CC coupling. Purer products are therefore obtained than in prior art,
CC enabling larger quantities and longer chains of oligoribonucleotides to
CC be synthesised successfully, and in shorter times

PT Enhancing immune response to an antigen.

XX Example 15; Page 177; 243pp; English.

XX The invention provides heat-killed Mycobacterium vaccae, or recombinant
CC M. vaccae proteins. The M. vaccae proteins may be employed to activate T
CC cells and natural killer cells, to stimulate the production of cytokines,
CC to enhance the expression of co-stimulatory molecules on dendritic cells
CC and monocytes, and to enhance dendritic cell maturation and function. The
CC proteins can be expressed by standard recombinant methodology.
CC Pharmaceutical compositions comprising the proteins or nucleic acid
CC sequences encoding the proteins can be used for the treatment,
CC prevention, and detection of disorders including infectious diseases,
CC immune disorders and cancer. In particular, the compounds and methods are
CC used for treatment of diseases of the respiratory system, such as
CC mycobacterial infections, asthma, allergies, tuberculosis, leprosy,
CC sarcoidosis and lung cancers, and disorders of the skin such as
CC psoriasis, atopic dermatitis, eczema, allergic contact dermatitis,
CC alopecia areata, and skin cancers such as basal carcinoma, squamous cell
CC carcinoma and melanoma

XX
CC This invention describes a novel method for quantitatively analysing a
CC biochemical compound (I) which comprises contacting (I) with double
CC stranded DNA fixed to the surface of an electrode at their terminals in
CC which electrochemically active threading intercalators are intercalated,
CC in an aqueous medium under application of electric potential to the
CC electrode in the presence of an oxidase which oxidizes the biochemical
CC compound and becomes reduced, and detecting electric current flowing
CC between the electrode and a second electrode in the aqueous medium. The
CC method is useful for detection of biochemical compounds such as glucose,
CC cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic
CC acid in body fluids such as whole blood, plasma, serum, urine, and lymph
CC for diagnosis of various diseases. The method allows detection of
CC in an aqueous medium under application of electric potential to the
CC electrode in the presence of an oxidase which oxidizes the biochemical

CC compound and becomes reduced, and detecting electric current flowing
CC between the electrode and a second electrode in the aqueous medium. The
CC method is useful for detection of biochemical compounds such as glucose,
CC cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic
CC acid in body fluids such as whole blood, plasma, serum, urine, and lymph
CC for diagnosis of various diseases. The method allows detection of
CC biochemical compounds quickly and easily with a high sensitivity using a
CC simple apparatus. This sequence represents DNA fragment used as a target
CC sample in the method of the invention

PT Preparation of mixed backbone oligomeric compounds useful as e.g. primers
PT for diagnostic tests, involves oxidation of H-phosphonate internucleoside
PT linkages to phosphodiester internucleoside linkages.
XX
PS Example 12; Page 34; 49pp; English.
XX
CC The present sequence is that of a phosphodiester oligonucleotide
CC containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group on its 5',
CC ribosyl sugar moiety. It is an example of an oligomeric compound produced
CC according to the methods of the invention. The invention provides
CC compounds and methods for the preparation of mixed backbone oligomeric,
CC or chimeric, compounds having phosphodiester internucleoside linkages in
CC addition to phosphorothioate and/or phosphoramidate internucleoside
CC linkages. The methods also include incorporation of boranophosphate
CC internucleoside linkages. The methods utilise H-phosphonate intermediates
CC that are coupled together forming contiguous regions of 1 or more H-
CC phosphonate internucleoside linkages. Each contiguous region is
CC subsequently oxidized to phosphodiester, phosphorothioate,
CC phosphoroamidate or boranophosphate internucleoside linkages prior to
CC this elongation. Mixed backbone oligomeric compounds are prepared in
CC oligomeric compounds of the invention are prepared using novel oxidation
CC steps that oxidize a region of 1 or more H-phosphonate internucleoside
CC linkages without degrading existing linkages that have been previously
CC oxidized. The oligonucleotides obtained are useful as primers in PCR,
CC probes, linkers, gene fragments and for other diagnostic tests on e.g.
CC biological tissue, fluid, cells etc., as research reagents, and as
CC antiviral agents

PS
XX
CC The invention relates to the use of an immunostimulatory single-stranded
CC DNA-binding protein in screening assays to identify compounds which bind
CC to it and thereby act as functional modifiers of immunostimulatory
CC oligodeoxynucleotide (ODN) activity. Such modifiers of ODN activity
CC consist of immunostimulatory DNA binding inhibitors, immunostimulatory
CC DNA mimics, and immunostimulatory DNA agonists and antagonists.
CC Immunostimulatory DNA-binding proteins can also be used in screening
CC methods to identify immunostimulatory DNA binding competitors, and to
CC optimize an immunostimulatory DNA-binding protein bound to an
CC complexes of an immunostimulatory DNA-binding protein. Isolated
CC immunostimulatory ODN can additionally be used to screen a panel of
CC immunostimulatory ODN to identify the cellular target molecules of
CC candidate target molecules to identify the cellular target molecules of
CC the immunostimulatory ODN. The immunostimulatory DNA-binding proteins
CC used in the methods of the invention are the RNA-binding proteins
CC nucleolin, hnRNP D, AUF1, hnRNP A1 and lupus La protein. The screening
CC methods are useful for identifying a compound that inhibits interaction
CC between immunostimulatory DNA and an immunostimulatory DNA-binding
CC protein and for identifying agonists useful in immunotherapy. The complex
CC is useful in screening for immunostimulatory DNA cellular target
CC molecules. The candidate immunostimulatory ODN competitors allow the
CC investigation of structure/activity relationships of immunostimulatory
CC DNA-binding proteins and immunostimulatory ODNs. The present sequence
CC represents an oligonucleotide used in an exemplification of the invention

XX
XX Example 1; Page 45; 95pp; English.
PS
XX
CC The invention relates to the use of an immunostimulatory single-stranded
CC DNA-binding protein in screening assays to identify compounds which bind
CC to it and thereby act as functional modifiers of immunostimulatory
CC oligodeoxynucleotide (ODN) activity. Such modifiers of ODN activity
CC consist of immunostimulatory DNA binding inhibitors, immunostimulatory
CC DNA mimics, and immunostimulatory DNA agonists and antagonists.
CC Immunostimulatory DNA-binding proteins can also be used in screening
CC methods to identify immunostimulatory DNA binding competitors, and to
CC optimize an immunostimulatory ODN for immune stimulation. Isolated
CC complexes of an immunostimulatory DNA-binding protein bound to an
CC immunostimulatory ODN can additionally be used to screen a panel of
CC candidate target molecules to identify the cellular target molecules of
CC the immunostimulatory ODN. The immunostimulatory DNA-binding proteins
CC used in the methods of the invention are the RNA-binding proteins
CC nucleolin, hnRNP D, AUF1, hnRNP A1 and lupus La protein. The screening
CC methods are useful for identifying a compound that inhibits interaction
CC between immunostimulatory DNA and an immunostimulatory DNA-binding
CC protein and for identifying agonists useful in immunotherapy. The complex
CC is useful in screening for immunostimulatory DNA cellular target
CC molecules. The candidate immunostimulatory ODN competitors allow the
CC investigation of structure/activity relationships of immunostimulatory
CC DNA-binding proteins and immunostimulatory ODNs. The present sequence
CC represents an oligonucleotide used in an exemplification of the invention

XX PT Fibronectin scaffold protein array for obtaining a protein/compound which

PT binds to a compound/protein, comprises a fibronectin type III domain

PT having a randomized loop, a randomized beta-sheet or their combination.

XX PS Disclosure; Page 41; 67pp; English.

XX CC The present invention relates to an array of proteins (antibody mimics)

CC comprising a fibronectin type III domain having a randomised loop, a

CC randomised beta-sheet, or their combination, and has the capacity to bind

CC to a compound that is not bound by a corresponding naturally- occurring

CC fibronectin, immobilised onto a solid support. The antibody mimics is

CC useful for detecting a compound preferably a protein, in a biological

CC sample. It is also useful to detect one or more different analytes

CC simultaneously in a sample. Hence is useful for diagnostic purposes. It

CC is also useful for the purpose of designing proteins capable of binding

CC to virtually any compound of interest. The present sequence is a capture

CC probe used to self-assemble and anchor the tenth module of human

CC fibronectin module of type III (Fn3) (10Fn3) which is used in an

CC exemplification of the invention

PT New substituted aryl conjugates of parent molecules, especially

PT oligonucleotides, having improved transmembrane and intracellular

PT transport properties, useful as medicaments or diagnostic agents.

XX PS Disclosure; Page 9; 28pp; German.

XX

CC This invention describes a novel conjugate (I) which consists of (A) a

CC molecule to be transported and (B) at least one aryl residue of formula -

CC Ar-(X-C(Y)-R₁)_n (II). Ar = group containing at least one aromatic ring;

CC X = O or N (sic); Y = O, S or NH-R₂ (sic); R₁ = optionally substituted

CC 1-23C alkyl (optionally containing double and/or triple bonds); R₂ =

CC optionally substituted 1-18C alkyl (optionally containing double and/or

CC triple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or

CC via a chemical group, provided that the chemical group is other than CH₂

CC -S if the bond is via a phosphodiester linkage of (A). The invention also

CC describes (i) the preparation of a conjugate (I') of (A') a molecule to

CC be transported and (B') at least one aryl residue (not restricted to

CC (II)), by preparing (A') containing a reactive function at the position

CC at which (B') is to be bonded, preparing (B') and reacting (A') and (B'); and

CC and (ii) the use of aryl groups (II) (optionally bonded via a chemical

CC group) for transporting (A) across biological membranes. The products of

CC the invention have cytostatic, virucide, vasotropic, dermatological,

CC antipsoriatic and antiasthmatic activity and can be used for gene

CC therapy. Conjugation of (A) with (B) is useful for transporting (A)

CC across biological membranes or into eukaryotic or prokaryotic cells

CC (specifically bacterial, yeast or mammalian cells, including human cells,

CC particularly tumor cells). Medicaments, diagnostic agents and test kits

CC containing (I) are also claimed. Typically (I) are antisense

CC oligonucleotide derivatives for tumor therapy; oligonucleotide drugs for

CC treating viral infections or diseases associated with integrins or cell-

CC cell interactions (e.g. restenosis, vitiligo, psoriasis or asthma); or

CC labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ

CC hybridization. Conjugation with (B) markedly improves the cellular uptake

CC of (A), e.g. in tumor cells. (B) include fluorescein derivative residues,

CC in which case the conjugates (I) are fluorescently labeled, allowing

CC microscopic monitoring of cellular uptake etc. The cellular uptake of (I)

CC is superior to that obtained using other conjugated groups related to

CC (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within

CC the scope of (B)) have superior uptake to corresponding fluorescein

CC conjugates

PT Detecting and separating nucleic acid, useful e.g. for diagnosis,
PT comprises reaction with nanoparticles that carry oligonucleotides
PT complementary to parts of the target.
XX
PS Example 18; Page 158; 404pp; English.
XX
XX
CC The invention relates to a method for detection of nucleic acid (I)
CC having at least 2 portions, comprising treatment with nanoparticles that
CC carry oligonucleotides complementary to at least 2 parts of (I), where
CC detectable change caused by hybridisation of the oligonucleotide to (I)
CC is observed. The method is used to detect (or to separate) specific (I),
CC e.g. for diagnosing a wide variety of diseases, sequencing, in forensic
CC analysis etc., and generally to detect analytes other than (I). The
CC oligonucleotide-derivatised nanoparticles are also useful for preparing
CC nanostructures useful, for example, as biochips, biofilters, mechanical
CC devices, separation membranes, chemical sensors, in computers, and for
CC drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be
CC produced, allowing their direct use (as probes) in polymerase chain
CC reaction, i.e. they survive multiple heating/cooling cycles so do not
CC need to be added after amplification. (I) are detected by simple colour
CC change, without the need for special equipment, making possible rapid
CC field testing for e.g. pathogens. AAS63374-AAS63448 represent
CC oligonucleotide-nanoparticle probes, and related sequences, used in the
CC method of the invention

PT Detecting nucleic acid, useful for e.g. diagnosis of diseases, forensics
PT and DNA sequencing, comprises observing detectable change brought about
PT by hybridization of nucleic acid with substrate or particle bound
PT oligonucleotides.
XX
PS Disclosure; Page 199; 205pp; English.
XX
CC The present sequence is an oligonucleotide used in a method for detecting
CC a nucleic acid having at least 2 portions. The method comprises
CC hybridising the nucleic acid with oligonucleotides, such as the present
CC sequence, attached to a substrate and/or particle and detecting a change
CC in colour, conductivity or optical density. The method is useful for the
CC diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing,
CC for paternity testing, for cell line authentication and for monitoring
CC gene therapy. Detecting nucleic acids based upon observing a colour
CC change is cheap, fast, simple, and does not require specialised or
CC expensive equipment. The nanoparticle oligonucleotide conjugates remain
CC stable for at least 6 months. A single base mismatch and as little as 20
CC femtomoles (fM) of target can be detected using the conjugates

XX PT Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or

PT viral diseases, by contacting the nucleic acid with oligonucleotides

PT attached to nanoparticles and having sequences complementary a portion of

PT the nucleic acid.

XX PS Example 24; Fig 44; 323pp; English.

XX CC The sequence represents a cyclic disulphide linked oligonucleotide which

CC may be coupled with colloidal gold particles (nanoparticles) and used to

CC demonstrate the method of the invention. The invention relates to

CC isolating or detecting a nucleic acid of interest, in a mixture of

CC nucleic acids, by binding it to 2 or more complementary nucleotides which

CC have a nanoparticle attached to their 5' ends. The nanoparticles (e.g.

CC colloidal gold) are used to both isolate and detect (e.g. by linking the

CC particle to a fluorescent probe) the resultant complex. The methods are

CC useful for detecting nucleic acids, natural or synthetic, and modified or

CC unmodified. The methods may also be applied in the diagnosis of genetic,

CC bacterial and viral diseases, in forensics, in DNA sequencing, for

CC paternity testing, for cell line authentication, and for monitoring gene

CC therapy. The methods are further useful in research and analytical

CC laboratories in DNA sequencing, in the field to detect the presence of

CC specific pathogens, for quick identification of an infection to assist in

CC drug prescription, and in homes and health centres for inexpensive first-

CC line screening. The methods, which are based on observing colour change

CC with the naked eye, are cheap, fast, simple, robust (reagents are

CC stable), do not require specialised or expensive equipment, and little or

CC no instrumentation is required

XX Preparing sulfurized 2' substituted phosphorothioate oligonucleotides
PT useful in biological research, comprises phosphitylating the 5'-hydroxyl
PT of a nucleic acid having a nucleoside with a 2' modification.
XX
XX Example 23; Col 11; 7pp; English.
XX
CC The present invention relates to a method for preparing phosphorothioate
CC oligonucleotides having at least one nucleoside with a 2' modification.
CC The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid
CC group having at least one nucleoside with a 2' modification in an
CC acetonitrile. The present sequence was used to illustrate the method of
CC the present invention. The method is useful for synthesising sulphurised
CC 2' substituted phosphorothioate oligonucleotides, which may be used in
CC molecular biological research, in applications such as anti-viral
CC therapy, and for determining the stereochemical pathways of certain
CC enzymes which recognise nucleic acids

PT Screening nucleic acids (NA) in pool of interest comprises pooling,
PT expressing NA to form expression product pool and identifying NA in NA
PT pool corresponding to expression product pool having interaction with
PT target moiety.
XX
PS Disclosure; Col 22; 19pp; English.
XX
CC The specification describes a method for identifying a nucleic acid in a
CC pool of interest. The method comprises pooling individually identifiable
CC nucleic acids into at least two pools of one nucleic acid each;

CC expressing nucleic acid pools to obtain protein expression product pools;
CC assaying protein expression product pools for products having interaction
CC with target molecule; selecting nucleic acid pools corresponding to
CC identified protein expression product pools; and identifying individual
CC nucleic acids in identified nucleic acid pools. The method is useful for
CC identifying a nucleic acid (e.g. cDNA) in a pool of interest and for
CC functionally screening several nucleic acids. The method is also useful
CC for screening genomic DNA libraries or other source of individual cDNAs,
CC mRNAs, synthetic libraries of nucleic acids e.g. combinatorial libraries.
CC The present sequence was used in the course of the invention

PT Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in
PT antisense therapy, by synthesizing oligonucleotides comprising backbone
PT of alkyl or alkoxy thiourea linkages in solution or on solid phase.
XX
PS Example 7; Fig 16; 48pp; English.
XX
CC The present sequence was used to demonstrate the ability of deoxynucleic
CC S-Methylthiourea (DNmt) compounds to form triplexes with DNA oligomers. An
CC increase in the C content of the oligos resulted in a large decrease in
CC binding. This experiment was performed as an example of a method for
CC preparing oligonucleotides comprising a backbone of alkyl or alkoxy
CC thiourea linkages. The method is useful for preparing oligonucleotides
CC for use in antisense or antigen therapy, to inhibit production of
CC proteins associated with genetic diseases, cardiovascular, inflammatory
CC and neurocellular diseases, and for antiviral therapy, e.g. to treat
CC human immunodeficiency virus, human-cytomegalovirus, influenza and herpes
CC infections. The compounds are also useful as diagnostic reagents to
CC detect the presence or absence of the target DNA or RNA sequences to

XX
PS Example 2; Page 10; 10pp; Japanese.

XX The invention relates to a method for detecting 1 base polymorphism on
CC the sequence of a chromosome or its fragment in which a sample nucleic
CC acid is reacted with a reaction liquor containing a nucleic acid primer
CC having a base adjacent to the polymorphic base at its 3'-end, one
CC dideoxynucleotide corresponding to a polymorphic base having a
CC distinguishable feature or its mixture, DNA polymerase and a composition
CC required for its activity expression to detect the presence of taking
CC dideoxynucleotide in the nucleic acid primer and to detect the type of
CC the base to be specified. The method is used for detecting 1 base
CC polymorphism on the sequence of a chromosome or its fragment. The present
CC sequence is that of a PCR primer, useful in examples of the invention

XX
PT Detecting nucleic acid, useful for diagnosis of genetic, viral or
PT bacterial disease, comprises hybridizing nanoparticles with attached
PT oligonucleotides to nucleic acid and detecting change brought about by
PT hybridization.

XX
PS Example 18; Page 410; 412pp; English.

XX
CC The invention relates to a method of detecting a nucleic acid (NA) having
CC at least 2 portions comprising: (a) providing nanoparticles (NP) with
CC attached oligonucleotides (OGN), where OGN has a sequence complementary
CC to the sequence of NA; (b) contacting NA and NP under conditions
CC effective to allow hybridisation of OGN with NA; and (c) observing a
CC detectable change brought about by hybridisation of OGN with NA. The
CC method is useful for detecting a nucleic acid, separating a selected
CC nucleic acid from others and methods of nanofabrication. Detecting

CC analytes such as nucleic acids and proteins are useful for the diagnosis
CC of genetic, bacterial and viral diseases. The OGN-NP conjugates that use
CC cyclic disulphide linkers improve the sensitivity of diagnostic assays.
CC In particular assays using OGN-NP conjugates prepared using linkers
CC comprising a steroid residue attached to a cyclic disulphide have been
CC found to be approximately 10 times more sensitive than assays employing
CC conjugates prepared using alkanethiols or acyclic disulphides as the
CC linker. The OGN-NP conjugates are stable allowing them to be used
CC directly in PCR solutions. Therefore conjugates added as probes to a DNA
CC target to be PCR amplified can be carried through the 30 or 40 heating
CC cooling cycles of the PCR and are still able to detect the amplicons
CC without opening the tubes and causing contamination. ABK64981-ABK65055

XX
PT Detecting nucleic acid, useful for diagnosis of genetic, viral or
PT bacterial disease, comprises hybridizing nanoparticles with attached
PT oligonucleotides to nucleic acid and detecting change brought about by
PT hybridization.

XX
PS Example 24; Fig 44; 412pp; English.

XX
CC The invention relates to a method of detecting a nucleic acid (NA) having
CC at least 2 portions comprising: (a) providing nanoparticles (NP) with
CC attached oligonucleotides (OGN), where OGN has a sequence complementary
CC to the sequence of NA; (b) contacting NA and NP under conditions
CC effective to allow hybridisation of OGN with NA; and (c) observing a
CC detectable change brought about by hybridisation of OGN with NA. The
CC method is useful for detecting a nucleic acid, separating a selected

CC nucleic acid from others and methods of nanofabrication. Detecting
CC analytes such as nucleic acids and proteins are useful for the diagnosis
CC of genetic, bacterial and viral diseases. The OGN-NP conjugates that use
CC cyclic disulphide linkers improve the sensitivity of diagnostic assays.
CC In particular assays using OGN-NP conjugates prepared using linkers
CC comprising a steroid residue attached to a cyclic disulphide have been
CC found to be approximately 10 times more sensitive than assays employing
CC conjugates prepared using alkanethiols or acyclic disulphides as the
CC linker. The OGN-NP conjugates are stable allowing them to be used
CC directly in PCR solutions. Therefore conjugates added as probes to a DNA
CC target to be PCR amplified can be carried through the 30 or 40 heating
CC cooling cycles of the PCR and are still able to detect the amplicons
CC without opening the tubes and causing contamination. ABK64981-ABK65055

CC The invention comprises antisense oligonucleotides that are capable of
CC inhibiting expression of the human clusterin gene. The antisense
CC oligonucleotides of the invention are useful for inhibiting the
CC expression of clusterin in cells. The antisense oligonucleotides are also
CC useful for treating an animal with a disease or condition associated with
CC clusterin (e.g. hypercholesterolaemia; cardiovascular disorders;
CC hyperproliferative disorders; and hyperlipidemic disorders). The present
CC DNA sequence represents a clusterin antisense oligonucleotide of the
CC invention. NOTE: The present DNA sequence has a phosphorothioate backbone
CC and also contains 2'-O-methoxyethyl wings

PT Synthesis of polynucleotide useful during fabrication of an array
PT involves coupling nucleoside phosphoramidite and a solid-supported
PT nucleoside and treating the product with an oxidation/deprotection
PT composition.
XX
PS Example 1; Page 15; 36pp; English.
XX
CC The present invention relates to a method for the synthesis of a
CC polynucleotide which involves coupling a second nucleoside to a first
CC nucleoside through a phosphite linkage, where the second nucleoside has a
CC non-carbonate protecting group protecting a hydroxyl, and exposing the
CC product to a composition which concurrently oxidizes the phosphite formed
CC to a phosphate and deprotects the protected hydroxyl of the second
CC nucleoside. The method is useful for synthesizing the polynucleotides,
CC for carrying out either 3' to 5' or 5' to 3' synthesis and for
CC fabricating an addressable array of polynucleotides on a substrate. The
CC present sequence is an oligonucleotide produced to demonstrate the method
CC of the invention

PT Detecting nucleic acid having two portions, by providing nanoparticles
PT having oligonucleotides attached to it, contacting nucleic acid and
PT nanoparticles to allow hybridization, and observing detectable change.
XX
PS Example 18; Page 437; 442pp; English.
XX
CC The invention describes a method of detecting (M1) a nucleic acid having
CC two portions, involving providing nanoparticles having oligonucleotides
CC attached to it, which has a sequence complementary to sequence of two
CC portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC allow hybridisation of oligonucleotides with two or more portions of
CC nucleic acid, and observing a detectable change brought about by
CC hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC conjugates (II) and the aggregate probe are useful for detecting two or
CC more nucleic acids (from a biological source) having at least two
CC portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC with a disease, synthetic, or structurally-modified natural or synthetic
CC RNA or DNA, or a product of a polymerase chain reaction amplification.
CC (II) is useful for preparing a nanoprobe conjugate for detecting an
CC analyte, and for detecting a nucleic acid bound to an electrode surface.
CC (I) and (II) are useful for fabrication, and for separating a selected
CC nucleic acid having two portions from other nucleic acids. (I), (II) and
CC the aggregate probe are useful for detecting an analyte (especially
CC polyvalent analyte) in a sample. This sequence represents a
CC polynucleotide used to demonstrate the method of the invention

PT Detecting nucleic acid having two portions, by providing nanoparticles
PT having oligonucleotides attached to it, contacting nucleic acid and
PT nanoparticles to allow hybridization, and observing detectable change.
XX
PS Example 24; Fig 44; 442pp; English.
XX
CC The invention describes a method of detecting (M1) a nucleic acid having
CC two portions, involving providing nanoparticles having oligonucleotides
CC attached to it, which has a sequence complementary to sequence of two
CC portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC allow hybridisation of oligonucleotides with two or more portions of
CC nucleic acid, and observing a detectable change brought about by
CC hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC conjugates (II) and the aggregate probe are useful for detecting two or
CC more nucleic acids (from a biological source) having at least two
CC portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC with a disease, synthetic, or structurally-modified natural or synthetic
CC RNA or DNA, or a product of a polymerase chain reaction amplification.
CC (II) is useful for preparing a nanoprobe conjugate for detecting an
CC analyte, and for detecting a nucleic acid bound to an electrode surface.
CC (I) and (II) are useful for fabrication, and for separating a selected
CC nucleic acid having two portions from other nucleic acids. (I), (II) and
CC the aggregate probe are useful for detecting an analyte (especially
CC polyvalent analyte) in a sample. This sequence represents a
CC polynucleotide used to demonstrate the method of the invention

PT New non-antibody proteins having an immunoglobulin fold, useful in
PT research, therapeutic or diagnostic fields, particularly as scaffolds for
PT designing proteins with specific properties, e.g. for binding any antigen
PT of interest.
XX
PS Disclosure; Page 58; 94pp; English.
XX
CC The present invention describes a non-antibody protein, comprising a
CC domain having an immunoglobulin-like fold, derived from a reference
CC protein having a mutated amino acid sequence, where the non-antibody
CC protein binds with a Kd at least as tight as 10 nM to a compound that is
CC not bound as tightly by the reference protein. The non-antibody protein
CC is useful as scaffolds for selecting or designing a protein framework
CC with specific and favourable properties, e.g. for binding any antigen of
CC interest, or for destroying or inactivating antibody molecules. The non-
CC antibody protein is also useful in all areas where antibodies are used,
CC e.g. research, therapeutic or diagnostic fields, and for screening novel
CC binding proteins useful in the above-mentioned fields. The present
CC proteins have thermodynamic properties superior to those of natural
CC antibodies, and can be evolved rapidly in vitro. The present proteins or
CC antibody mimics exhibit improved biophysical properties, such as
CC stability under reducing conditions and solubility at high
CC concentrations. In addition, these molecules are readily expressed and
CC folded in prokaryotic systems (e.g. Escherichia coli), in eukaryotic
CC systems (e.g. yeast), or in in vitro translation systems (e.g. rabbit
CC reticulocyte lysate system). Furthermore, these proteins are extremely
CC amenable to affinity maturation techniques involving multiple cycles of
CC selection, e.g. in vitro selection using RNA-protein fusion technology,
CC phage display or yeast display systems. The present sequence is used in
XX the exemplification of the present invention

XX New DNA sequences from potato, useful for producing plants with altered

PT properties, e.g. tolerance of flooding, also related proteins, antibodies

PT and inhibitory sequences.

XX Example 1; Page 8; 26pp; German.

PS The invention relates to DNA sequences (I) that encode six specific plant

XX proteins: (i) a protein (ABP60425) with mitochondrial carrier protein

CC activity (IIa); (ii) a protein (ABP60426) with transferrin binding

CC protein activity (IIB); (iii) a protein (ABP60427) with receptor-like

CC protein kinase activity (IIC); (iv) a protein (ABP60428) with elongation

CC factor EF-2 activity (IID); (v) a protein (ABP60429) with non-long

CC terminal repeat retroelement reverse transcriptase activity (IIE); or

CC (vi) a protein (ABP60430) with helicase activity (IIF). (I), also related

CC sequences, derived ribozymes and antisense sequences, expression vectors,

CC encoded proteins and antibodies against the proteins, are used to produce

CC plants with altered properties, including tolerance of overwatering. The

CC antibodies are also used for isolation of the proteins and in

CC immunoassays. Also (I) or their primer or probe fragments are used to

CC screen for terminators and constitutively, aerobically or anaerobically

CC inducible plant promoters, specifically for use in potatoes and the

CC sequence that encodes (IID) is used to alter the translation profile in

CC plants. Since (I) are derived from potato, their promoters and

CC terminators provide high level transgene expression in potato, with

CC improved tissue specificity and inducibility, and can also be used to

CC control endogenous genes. The present sequence is that of a PCR primer

CC used in the first strand synthesis of cDNAs derived from Potato

PT Detecting nucleic acids having at least 2 portions comprises use of

PT nanoparticles which have oligonucleotides attached to them that are

PT complementary to portions of the nucleic acid sequence.

XX

PS Example 18; Page 44; 130pp; English.

XX

CC The invention relates to detecting a nucleic acid (NA) having at least 2

CC portions, comprises providing a type of nanoparticles (NP) having

CC attached to oligonucleotides (O) (O) on each NP has a sequence

CC complementary to sequence of at least 2 portions of NA), contacting NA

CC and NP to allow hybridisation of (O) on NP with 2 or more portions of NA,

CC and observing a detectable change brought about by hybridisation of (O)

CC on NP with NA. The nanoparticle is useful for separating a selected

CC nucleic acid having at least 2 portions, from other nucleic acids, and

CC for detecting nucleic acids having at least 2 portions. The method of

CC using NP is useful for detecting any type of nucleic acids which may be

CC used for diagnosis of disease and in sequencing of nucleic acids.

CC Preferably, the method is useful for detecting nucleic acids for

CC diagnosis and/or monitoring of viral diseases (human immunodeficiency

CC virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr

CC virus), bacterial diseases, sexually transmitted diseases, inherited

CC disorders, in forensics, in DNA sequencing, for paternity testing, for

CC cell line authentication and for monitoring gene therapy. The method is

CC useful in research and analytical laboratories in DNA sequencing and in

CC the field to detect the presence of specific pathogens. Detecting nucleic

CC acids based on observing a colour change with the naked eye is cheap,

CC fast, simple and robust, and do not require specialised expensive

CC equipment. The present sequence is a nanoparticle (e.g. gold particles)

CC labelled probe used to demonstrate the method of the invention

PT Detection of nucleic acid having -2 portions used to prepare biomaterials
PT and in nanofabrication methods, comprises providing nanoparticles,
PT contacting nucleic acid and nanoparticles, and observing change.
PS Example 18; Page 44; 130pp; English.
XX
CC This invention relates to a novel method for detecting nucleic acids. The
CC method comprises providing nanoparticles with oligonucleotides attached
CC to them, which have a sequence complementary to a sequence of two
CC portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC to allow hybridisation of the oligonucleotides with two or more portions
CC of the nucleic acid, and observing a detectable change brought about by
CC the hybridisation. The nucleic acid to be detected must have at least two
CC portions and the distances between these are chosen so that when the
CC nanoparticle-oligonucleotide conjugate binds the target sequence a
CC detectable change occurs. The method of the invention is useful for
CC detecting two or more nucleic acids (from a biological source) having at
CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC associated with a disease, synthetic, or structurally- modified natural
CC or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC and for detecting a nucleic acid bound to an electrode surface.
CC Nanoparticles and nanoparticle conjugates of the invention are useful for
CC nanofabrication and for separating a selected nucleic acid having two
CC portions from other nucleic acids. Diagnostic assays employing

CC nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC nucleic acid detection methods and can be used to detect nucleic acids
CC that are present in only small amounts in a sample. The invention also
CC provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC conjugates are stable with tailored hybridisation abilities. The present
CC sequence represents a thiol modified oligonucleotide sequence used to
CC demonstrate the method of the invention

PT Detection of nucleic acid having at least two portions, by contacting
PT nucleic acid and nanoparticles under conditions, which allows
PT hybridization of oligonucleotides on nanoparticles with at least two
PT portions of nucleic acid.
XX
PS Example 18; Page 44; 108pp; English.
XX
CC This invention relates to a novel method for detecting nucleic acids. The
CC method comprises providing nanoparticles with oligonucleotides attached
CC to them, which have a sequence complementary to a sequence of two
CC portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC to allow hybridisation of the oligonucleotides with two or more portions
CC of the nucleic acid, and observing a detectable change brought about by
CC the hybridisation. The nucleic acid to be detected must have at least two

CC portions and the distances between these are chosen so that when the
CC nanoparticle-oligonucleotide conjugate binds the target sequence a
CC detectable change occurs. The method of the invention is useful for
CC detecting two or more nucleic acids (from a biological source) having at
CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC associated with a disease, synthetic, or structurally- modified natural
CC or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC and for detecting a nucleic acid bound to an electrode surface.
CC Nanoparticles and nanoparticle conjugates of the invention are useful for
CC nanofabrication and for separating a selected nucleic acid having two
CC portions from other nucleic acids. Diagnostic assays employing
CC nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC nucleic acid detection methods and can be used to detect nucleic acids
CC that are present in only small amounts in a sample. The invention also
CC provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC conjugates are stable with tailored hybridisation abilities. The present
CC sequence represents a thiol modified oligonucleotide sequence used to
CC demonstrate the method of the invention

CC least two portions by providing a type of nanoparticle-oligonucleotide
CC conjugate, contacting the nucleic acid and nanoparticles to allow
CC hybridisation of the oligonucleotides with the two or more portions of
CC the nucleic acid and observing a detectable change brought about by
CC hybridisation. The oligonucleotides have a sequence complementary to the
CC sequence of at least two portions of the nucleic acid. Hybridisation of
CC the oligonucleotides on the nanoparticles with the nucleic acid results
CC in a detectable change. This sequence represents a linking
CC oligonucleotide of the invention.

XX
PT Non-nucleotide probe for suppressing binding of detectable nucleic acid
PT probes to undesired sequences, has aggregate nucleobase sequence
PT homologous to randomly distributed repeat sequence of genomic nucleic
PT acid.

PS Claim 10; SEQ ID NO 14; 103pp; English.

XX
CC The present sequence represents a non-nucleotide probe. The probe is
CC useful for suppressing the binding of one or more detectable nucleic acid
CC probes, that are greater than 100 base pairs and that have been derived
CC from genomic nucleic acid, to one or more undesired sequences in an assay
CC for determining target genomic nucleic acid of a sample. The method
CC comprises contacting the sample with the mixture of probes (preferably
CC comprising 5-50 probes), contacting the sample with the one or more
CC detectable nucleic acid probes, and determining the target genomic
CC nucleic acid of the sample by determining the hybridization of the one or
CC more detectable nucleic acid probes to the target genomic nucleic acid of
CC the sample. The genomic nucleic acid is contained in a fixed tissue or a
CC cell, and the sample is metaphase spreads, interphase nucleic or nucleic
CC found in paraffin embedded tissue material or frozen tissue sections. The
CC probe is also useful in comparing a sample of genomic nucleic acid with
CC that of a control sample using a genomic nucleic acid reference array.
CC The method comprises treating a sample of genomic nucleic acid and
CC control genomic nucleic acid, which are differentially labelled, the
CC array or both the sample and control genomic nucleic acid and the array
CC with the mixture of the probe under suitable hybridization conditions,
CC contacting the array with treated mixture of sample and control genomic
CC nucleic acid under suitable hybridization conditions, and comparing the
CC intensities of the signals from the differential labels of the array to
CC that caused by hybridization of the probes to genomic nucleic acid, thus
CC determining one or more variations in copy numbers of sequences in the
CC sample as compared with the relative copy numbers of substantially
CC identical sequences in the control. The hybridization of the genomic
CC array is determined using an intercalating dye or a detectable antibody,

CC or its fragment, that is specific for a nucleic acid/nucleic acid hybrid.
CC The sample of genomic nucleic acid to be tested and the reference of
CC nucleic acid are labelled with detectable moiety such that hybridization
CC of the genomic array is determined by determining the presence, absence,
CC amount or location of the detectable label on the one or more genomic
CC arrays. The genomic array comprises nucleic acid that is prepared from
CC Bacterial Artificial Chromosome (BAC) clones. The present sequence
CC represents a non-nucleotide probe of the invention.

Non-nucleotide probe for suppressing binding of detectable nucleic acid
probes to undesired sequences, has aggregate nucleobase sequence
homologous to randomly distributed repeat sequence of genomic nucleic
acid.
Claim 10; SEQ ID NO 26; 103pp; English.

The present sequence represents a non-nucleotide probe. The probe is
useful for suppressing the binding of one or more detectable nucleic acid
probes, that are greater than 100 base pairs and that have been derived
from genomic nucleic acid, to one or more undesired sequences in an assay
for determining target genomic nucleic acid of a sample. The method
comprises contacting the sample with the mixture of probes (preferably
comprising 5-50 probes), contacting the sample with the one or more
detectable nucleic acid probes, and determining the target genomic
nucleic acid of the sample by determining the hybridization of the one or
more detectable nucleic acid probes to the target genomic nucleic acid of
the sample. The genomic nucleic acid is contained in a fixed tissue or a
cell, and the sample is metaphase spreads, interphase nucleic or nucleic
found in paraffin embedded tissue material or frozen tissue sections. The
probe is also useful in comparing a sample of genomic nucleic acid with
that of a control sample using a genomic nucleic acid reference array.
The method comprises treating a sample of genomic nucleic acid and

CC control genomic nucleic acid, which are differentially labelled, the
CC array or both the sample and control genomic nucleic acid and the array
CC with the mixture of the probe under suitable hybridization conditions,
CC contacting the array with treated mixture of sample and control genomic
CC nucleic acid under suitable hybridization conditions, and comparing the
CC intensities of the signals from the differential labels of the array to
CC that caused by hybridization of the probes to genomic nucleic acid, thus
CC determining one or more variations in copy numbers of sequences in the
CC sample as compared with the relative copy numbers of substantially
CC identical sequences in the control. The hybridization of the genomic
CC array is determined using an intercalating dye or a detectable antibody,
CC or its fragment, that is specific for a nucleic acid/nucleic acid hybrid.
CC The sample of genomic nucleic acid to be tested and the reference of
CC nucleic acid are labelled with detectable moiety such that hybridization
CC of the genomic array is determined by determining the presence, absence,
CC amount or location of the detectable label on the one or more genomic
CC arrays. The genomic array comprises nucleic acid that is prepared from
CC Bacterial Artificial Chromosome (BAC) clones. The present sequence
CC represents a non-nucleotide probe of the invention.

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 3509; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of ubiquinone
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

XX
CC The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
